# SIGN-CHANGING SOLUTIONS FOR CRITICAL EQUATIONS WITH HARDY POTENTIAL 

PIERPAOLO ESPOSITO, NASSIF GHOUSSOUB, ANGELA PISTOIA, AND GIUSI VAIRA

#### Abstract

We consider the following perturbed critical Dirichlet problem involving the HardySchrödinger operator on a smooth bounded domain $\Omega \subset \mathbb{R}^{N}, N \geq 3$, with $0 \in \Omega$ : $$
\begin{cases}-\Delta u-\gamma \frac{u}{|x|^{2}}-\epsilon u=|u|^{\frac{4}{N-2}} u & \text { in } \Omega \\ u=0 & \text { on } \partial \Omega\end{cases}
$$ when $\epsilon>0$ is small and $\gamma<\frac{(N-2)^{2}}{4}$. Setting $\gamma_{j}=\frac{(N-2)^{2}}{4}\left(1-\frac{j(N-2+j)}{N-1}\right) \in(-\infty, 0]$ for $j \in \mathbb{N}$, we show that if $\gamma \leq \frac{(N-2)^{2}}{4}-1$ and $\gamma \neq \gamma_{j}$ for any $j$, then for small $\epsilon$, the above equation has a positive -non variational- solution that develops a bubble at the origin. If moreover $\gamma<\frac{(N-2)^{2}}{4}-4$, then for any integer $k \geq 2$, the equation has for small enough $\epsilon$, a sign-changing solution that develops into a superposition of $k$ bubbles with alternating sign centered at the origin. The above result is optimal in the radial case, where the condition that $\gamma \neq \gamma_{j}$ is not necessary. Indeed, it is known that, if $\gamma>\frac{(N-2)^{2}}{4}-1$ and $\Omega$ is a ball $B$, then there is no radial positive solution for $\varepsilon>0$ small. We complete the picture here by showing that, if $\gamma \geq \frac{(N-2)^{2}}{4}-4$, then the above problem has no radial sign-changing solutions for $\varepsilon>0$ small. These results recover and improve what is known in the non-singular case, i.e., when $\gamma=0$.

## 1. Introduction

We consider existence issues for the following Dirichlet problem:

$$
\begin{cases}-\Delta u-\gamma \frac{u}{|x|^{2}}-\lambda u=|u|^{\frac{4}{N-2}} u & \text { in } \Omega  \tag{1.1}\\ u=0 & \text { on } \partial \Omega\end{cases}
$$

where $\Omega \subset \mathbb{R}^{N}, N \geq 3$, is a smooth bounded domain with $0 \in \Omega, \gamma<\frac{(N-2)^{2}}{4}$ and $\lambda \in \mathbb{R}$. Problem (1.1) is the Euler-Lagrange equation of the following action functional

$$
J_{\lambda}(u)=\frac{1}{2} \int_{\Omega}|\nabla u|^{2}-\frac{\gamma}{2} \int_{\Omega} \frac{u^{2}}{|x|^{2}}-\frac{\lambda}{2} \int_{\Omega} u^{2}-\frac{N-2}{2 N} \int_{\Omega}|u|^{\frac{2 N}{N-2}}, \quad u \in H_{0}^{1}(\Omega)
$$

Since $\frac{(N-2)^{2}}{4}$ is the best constant in the classical Hardy inequality:

$$
\frac{(N-2)^{2}}{4}=\inf \left\{\int_{\Omega}|\nabla u|^{2}: u \in H_{0}^{1}(\Omega) \text { s.t. } \int_{\Omega} \frac{u^{2}}{|x|^{2}}=1\right\}
$$

see [22], we have that

$$
\begin{equation*}
\int_{\Omega}|\nabla u|^{2}-\gamma \int_{\Omega} \frac{u^{2}}{|x|^{2}} \geq\left(1-\frac{4 \gamma}{(N-2)^{2}}\right) \int_{\Omega}|\nabla u|^{2} \quad \forall u \in H_{0}^{1}(\Omega) \tag{1.2}
\end{equation*}
$$

It is then useful to equip the Hilbert space $H_{0}^{1}(\Omega)$ with the inner product

$$
\langle u, v\rangle=\int_{\Omega} \nabla u \nabla v-\gamma \int_{\Omega} \frac{u v}{|x|^{2}}
$$

and the assumption $\gamma<\frac{(N-2)^{2}}{4}$ guarantees that the induced norm $\|\cdot\|$ is equivalent to the usual one in view of (1.2). Letting $L_{\gamma}=-\Delta-\frac{\gamma}{|x|^{2}}$ be the Hardy operator, let us denote by $0<\lambda_{1} \leq \lambda_{2} \leq \ldots$ the eigenvalues of $L_{\gamma}$.
For $\lambda<\lambda_{1}$ positive solutions of (1.1) can be found through the minimization problem:

$$
S_{\gamma, \lambda}(\Omega)=\inf \left\{\|u\|^{2}-\lambda \int_{\Omega} u^{2}: u \in H_{0}^{1}(\Omega) \text { s.t. } \int_{\Omega}|u|^{\frac{2 N}{N-2}}=1\right\} .
$$

When $\lambda=0$, it is classical to see that $S_{\gamma, 0}(\Omega)=S_{\gamma, 0}\left(\mathbb{R}^{N}\right)$ and is never attained, the difficulty being here that (1.1) is doubly critical for the presence of the Hardy potential $\frac{1}{|x|^{2}}$ and the nonlinearity $|u|^{\frac{4}{N-2}} u$. Extremals for $S_{\gamma, 0}\left(\mathbb{R}^{N}\right)$ exist for $\gamma \geq 0$ and have the form (up to a multiplicative constant)

$$
\begin{equation*}
U_{\mu}(x)=\mu^{-\frac{N-2}{2}} U\left(\frac{x}{\mu}\right)=\frac{\alpha_{N} \mu^{\Gamma}}{|x|^{\beta-}\left(\mu^{\frac{4 \Gamma}{N-2}}+|x|^{\frac{4 \Gamma}{N-2}}\right)^{\frac{N-2}{2}}}, \quad \mu>0 \tag{1.3}
\end{equation*}
$$

where

$$
\begin{equation*}
U(x)=\frac{\alpha_{N}}{|x|^{\beta^{-}}\left(1+|x|^{\frac{4 \Gamma}{N-2}}\right)^{\frac{N-2}{2}}}=\frac{\alpha_{N}}{\left(|x|^{\frac{2}{N-2} \beta^{-}}+|x|^{\frac{2}{N^{-2}} \beta^{+}}\right)^{\frac{N-2}{2}}} \tag{1.4}
\end{equation*}
$$

with

$$
\begin{equation*}
\Gamma=\sqrt{\frac{(N-2)^{2}}{4}-\gamma}, \quad \beta_{ \pm}=\frac{N-2}{2} \pm \Gamma, \quad \alpha_{N}=\left[\frac{4 \Gamma^{2} N}{N-2}\right]^{\frac{N-2}{4}} \tag{1.5}
\end{equation*}
$$

see $[9,12,30]$. For $\gamma<0$ the problem is even more difficult since $S_{\gamma, 0}\left(\mathbb{R}^{N}\right)=S_{0,0}\left(\mathbb{R}^{N}\right)$ is not attained, even though (1.3) is still a family of positive solutions to

$$
\begin{equation*}
-\Delta U-\gamma \frac{U}{|x|^{2}}=U^{\frac{N+2}{N-2}} \text { in } \mathbb{R}^{N} \backslash\{0\} \tag{1.6}
\end{equation*}
$$

As in the classical Brézis-Nirenberg problem [3], on a bounded domain $\Omega$ the presence of a linear perturbation with $0<\lambda<\lambda_{1}$ results in a symmetry breaking which is responsible for the existence of minimizers for $S_{\gamma, \lambda}(\Omega)$ [20, 25, 29]. More precisely, a positive ground-state solution for (1.1) is found when

- $\gamma \leq 0$ and either

$$
N=3 \text { and the "Robin" function } R_{\gamma, \lambda}>0 \text { somewhere }
$$

or

$$
N \geq 4, \quad \lambda>|\gamma| \inf \left\{\frac{1}{|x|^{2}}: x \in \Omega\right\}
$$

- $0<\gamma \leq \frac{(N-2)^{2}}{4}-1$
- $\max \left\{0, \frac{(N-2)^{2}}{4}-1\right\}<\gamma<\frac{(N-2)^{2}}{4}$ and "mass" $m_{\gamma, \lambda}>0$.

The question has been completely settled in [20], which we refer to for a precise definition of $R_{\gamma, \lambda}$ and $m_{\gamma, \lambda}$, and the ranges displayed above are essentially optimal for the attainability of $S_{\gamma, \lambda}(\Omega)$, see also the recent survey [18]. Notice that the cases $\gamma<0$ and $\gamma=0, N=3$ always require $\lambda$ to be sufficiently away from zero.
By Pohozaev identity [28] equation (1.1) has no solution when $\lambda \leq 0$ on domains which are strictly starshaped w.r.t. 0 . Since solutions of (1.1) can't have a given sign when $\lambda \geq \lambda_{1}$, to attack existence issues for general $\lambda$ 's one needs to search for sign-changing solutions. We can summarize the available results in literature $[5,6,7,10,11,16]$ as:

- if $0 \leq \gamma<\frac{(N-2)^{2}}{4}-4$ there are infinitely many sign-changing solutions for all $\lambda>0$
- if $\max \left\{0, \frac{(N-2)^{2}}{4}-4\right\} \leq \gamma<\frac{(N-2)^{2}}{4}-\frac{(N+2)^{2}}{N^{2}}$ there exists a sign-changing solution for all $\lambda \geq \lambda_{1}$
- if $\max \left\{0, \frac{(N-2)^{2}}{4}-\frac{(N+2)^{2}}{N^{2}}\right\} \leq \gamma \leq \frac{(N-2)^{2}}{4}-1$ there exists a sign-changing solution for all

$$
\lambda \in \bigcup_{k=1}^{\infty}\left(\lambda_{k}, \lambda_{k+1}\right)
$$

- if $\gamma \geq 0$ and $\frac{(N-2)^{2}}{4}-1<\gamma<\frac{(N-2)^{2}}{4}$ there exist $n_{k}$ sign-changing solutions for all $\lambda$ in a suitable left open neighborhood of $\lambda_{k}, k \geq 2$, where $n_{k}$ is the multiplicity of $\lambda_{k}$.
Assumption $\gamma \geq 0$ allows here to use $U_{\mu}$, which are extremals of $S_{\gamma, 0}\left(\mathbb{R}^{N}\right)$, as an helpful family of test functions in a variational approach.
Hereafter, we restrict our attention to the regime $\lambda=\varepsilon$, with $\varepsilon>0$ small:

$$
\begin{cases}-\Delta u-\gamma \frac{u}{|x|^{2}}-\varepsilon u=|u|^{\frac{4}{N-2}} u & \text { in } \Omega  \tag{1.7}\\ u=0 & \text { on } \partial \Omega\end{cases}
$$

When $\gamma=0 S_{0, \varepsilon}(\Omega)$ is not achieved $[3,14,15]$ for $N=3$, and (1.7) in the ball $B=B_{1}(0)$ admits no positive solutions for $N=3[3]$ and no radial sign-changing solutions for $N=3,4,5,6[1,2]$. In the singular case, a similar situation arises depending now on $\gamma$ : $S_{\gamma, \varepsilon}(\Omega)$ is not achieved [20] when either $\gamma<0$ or $\gamma>\frac{(N-2)^{2}}{4}-1$, and (1.7) in $B$ admits no radial positive solutions [8] for $\gamma>\frac{(N-2)^{2}}{4}-1$. Our first main result, along with Theorem 1.2 below, completes the picture in a radial setting:
Theorem 1.1. When $\gamma \geq \frac{(N-2)^{2}}{4}-4$ problem (1.7) has no radial sign-changing solutions in $B$ for $\varepsilon>0$ small.

Theorem 1.1 is based on a fine asymptotic analysis combined with Pohozaev identities. In this way we also recover, see the precise statement in Corollary 2.3, the results in [1, 2] and [8] concerning the regular case $\gamma=0$ and the singular case $\gamma>\frac{(N-2)^{2}}{4}-1$, respectively. Moreover, when $\gamma<\frac{(N-2)^{2}}{4}-4$ the analysis shows that radial sign-changing solutions need to develop in a very precise way a bubble of alternating towers centered at 0 as $\varepsilon \rightarrow 0^{+}$, recovering and improving the discussion in [23] concerning the asymptotics of radial least-energy sign-changing solutions in the regular case $\gamma=0$ when $N \geq 7$. Once the radial case is well understood, we can attack by
a perturbative approach the case of a general domain $\Omega$ leading to the following result, which is optimal in the radial case.

Theorem 1.2. Let

$$
\begin{equation*}
\gamma_{j}=\frac{(N-2)^{2}}{4}\left(1-\frac{j(N-2+j)}{N-1}\right) \in(-\infty, 0], \quad j \in \mathbb{N} \tag{1.8}
\end{equation*}
$$

Assume that either $\Omega$ is a general domain with $\gamma \neq \gamma_{j}$ for all $j \in \mathbb{N}$ or $\Omega$ is $j$-admissible (see Definition 3.3 and Remark 3.4) with $\gamma=\gamma_{j}$ for some $j \in \mathbb{N}$.
i) Let $\gamma \leq \frac{(N-2)^{2}}{4}-1$. Then there exists $\varepsilon_{1}>0$ such that for all $\varepsilon \in\left(0, \varepsilon_{1}\right)$ problem (1.7) has a positive solution $u_{\varepsilon}$ developing a bubble at the origin.
ii) Let $\gamma<\frac{(N-2)^{2}}{4}-4$. For any integer $k \geq 2$ there exists $\varepsilon_{k}>0$ such that for all $\varepsilon \in\left(0, \varepsilon_{k}\right)$ problem (1.7) has a sign-changing solution $u_{\varepsilon}$, which looks like the superposition of $k$ bubbles with alternating sign centered at the origin.

Theorem 1.2-(i) provides positive solutions of (1.7) for $\gamma<0$ which are not minimizers for $S_{\gamma, \varepsilon}(\Omega)$, exactly as $U_{\mu}$ are solutions of (1.6) which are not extremals for $S_{\gamma, 0}\left(\mathbb{R}^{N}\right)$. More generally, our result allows to consider the case $\gamma<0$ which cannot be dealt in a variational way when $\varepsilon>0$ is small. When $0 \leq \gamma<\frac{(N-2)^{2}}{4}-4$ the solutions we found likely coincide with the infinitely many ones found in $[7,11]$.

The paper is organized as follows. In Section 2 we discuss the asymptotic behavior for radial solutions of problem (1.7) in $B$ with $\epsilon \rightarrow 0^{+}$, establishing in particular the validity of Theorem 1.1. In Sections 3 and 4 we deduce Theorem 1.2 by developing a very delicate perturbative approach where a crucial splitting of the remainder term is performed, see $[24,26]$ for related results. In the Appendix 5 we collect several technical estimates.

## 2. Asymptotic analysis in the radial case: proof of Theorem 1.1

In this section we will consider the case when $\Omega$ is the unit ball $B$. From now on, for any function $u \in L^{q}(A), 1 \leq q \leq+\infty$, we let $|u|_{q, A}=\left(\int_{A}|u|^{q} d x\right)^{1 / q}$ and $|u|_{q}=|u|_{q, \Omega}$. We will denote by $c, C$ various positive constants which can vary from lines to lines.

Let $u \in H_{0}^{1}(B)$ be a radial solution of (1.1). The function

$$
\begin{equation*}
v(r)=\left(\frac{N-2}{2 \Gamma}\right)^{\frac{N-2}{2}} r^{\frac{N-2}{2}\left(\frac{N-2}{2 \Gamma}-1\right)} u\left(r^{\frac{N-2}{2 \Gamma}}\right) \tag{2.1}
\end{equation*}
$$

is in $H_{0}^{1}(B)$ and is a radial solution of

$$
\begin{equation*}
-\Delta v=|v|^{\frac{4}{N-2}} v+\varepsilon|x|^{\alpha} v \text { in } B \backslash\{0\}, v=0 \text { on } \partial B \tag{2.2}
\end{equation*}
$$

where $\alpha=\frac{N-2}{\Gamma}-2$ and $\varepsilon=\left(\frac{N-2}{2 \Gamma}\right)^{2} \lambda$. We have the following simple description of nodal regions:
Lemma 2.1. Given $\alpha>-2$, any non-trivial radial solution $v \in H_{0}^{1}(B)$ of $(2.2)$ is in $C(\bar{B}) \cap$ $C^{2}(\bar{B} \backslash\{0\})$ and, if $\epsilon>0$ and $v(0)>0$, there exist an integer $k=k(v) \geq 1$ and $R_{0}=r_{1}=0<$ $R_{1}<r_{2}<\cdots<R_{k-1}<r_{k}<R_{k}=r_{k+1}=1$ so that for all $j=1, \ldots, k$

$$
(-1)^{j-1} v>v\left(R_{j}\right)=0 \text { in }\left(R_{j-1}, R_{j}\right), \quad(-1)^{j} v^{\prime}>v^{\prime}\left(r_{j}\right)=0 \text { in }\left(r_{j}, r_{j+1}\right)
$$

with the convention $v^{\prime}(0)=0$. Moreover, there exists $\varepsilon_{0}>0$ small, independent on $v$, so that for all $0<\varepsilon \leq \varepsilon_{0}$ there holds

$$
\begin{equation*}
\int_{A}|v|^{\frac{2 N}{N-2}} \geq\left(\frac{S}{2}\right)^{\frac{N}{2}} \tag{2.3}
\end{equation*}
$$

for any nodal region $A$ of $v$, where $S=S_{0,0}\left(\mathbb{R}^{N}\right)$ is the Sobolev constant.

Proof. Since $\alpha>-2$, we have that

$$
\begin{equation*}
|x|^{\alpha} \in L^{p}(B) \text { for some } p>\frac{N}{2} \tag{2.4}
\end{equation*}
$$

Since by the Sobolev embedding theorem $v \in L^{\frac{2 N}{N-2}}(B)$, for any $\eta>0$ we can decompose $|v|^{\frac{4}{N-2}}+$ $\varepsilon|x|^{\alpha}$ as $f_{1}+f_{2}$ with $\left|f_{1}\right|_{\frac{N}{2}} \leq \eta$ and $f_{2} \in L^{\infty}(B)$ in view of (2.4). We can re-write (2.2) as

$$
v-(-\Delta)^{-1}\left(f_{1} v\right)=(-\Delta)^{-1}\left(f_{2} v\right)
$$

By elliptic regularity theory and the Sobolev embedding $W^{2, \frac{N s}{N+2 s}}(B) \hookrightarrow L^{s}(B)$ we have that

$$
\begin{equation*}
\left|(-\Delta)^{-1}\left(f_{1} v\right)\right|_{s} \leq C \|\left.(-\Delta)^{-1}\left(f_{1} v\right)\right|_{W^{2, \frac{N s}{N+2 s}}} \leq C\left|f_{1} v\right|_{\frac{N s}{N+2 s}} \leq C \eta|v|_{s} \tag{2.5}
\end{equation*}
$$

in view of the Hölder's inequality and $\left|f_{1}\right|_{\frac{N}{2}} \leq \eta$. Equivalently $H: v \in L^{s}(B) \rightarrow(-\Delta)^{-1}\left(f_{1} v\right) \in$ $L^{s}(B)$ has operatorial norm $\leq C \eta$, and then the operator $\mathrm{Id}-H: L^{s}(B) \rightarrow L^{s}(B)$ is invertible for all $s>1$ and $\eta$ sufficiently small. Arguing as in (2.5), we have that

$$
|v|_{\frac{N s}{N-2 s}} \leq\left\|(\operatorname{Id}-H)^{-1}\right\|\left|(-\Delta)^{-1}\left(f_{2} v\right)\right|_{\frac{N s}{N-2 s}} \leq C\left|f_{2} v\right|_{s} \leq C\left|f_{2}\right|_{\infty}|v|_{s}
$$

when $s<\frac{N}{2}$ and for all $q>1$

$$
|v|_{q} \leq\left\|(\operatorname{Id}-H)^{-1}\right\|\left|(-\Delta)^{-1}\left(f_{2} v\right)\right|_{q} \leq C\left|f_{2} v\right|_{s} \leq C\left|f_{2}\right|_{\infty}|v|_{s}
$$

when $s \geq \frac{N}{2}$. Starting from $v \in L^{\frac{2 N}{N-2}}(B)$ we iteratively prove that $v \in L^{s}(B)$ for all $s>1$, and then $|v|^{\frac{4}{N-2}} v+\varepsilon|x|^{\alpha} v \in L^{\frac{N+2 p}{4}}(B) \cap L_{\text {loc }}^{s}(\bar{B} \backslash\{0\})$ for all $s>1$, where $p$ is given in (2.4). Since $\frac{N+2 p}{4}>\frac{N}{2}$, by elliptic regularity theory we deduce that $v \in C(\bar{B}) \cap C^{2}(\bar{B} \backslash\{0\})$. Moreover, we claim that

$$
\begin{equation*}
\lim _{r \rightarrow 0} r^{N-1} v^{\prime}(r)=0 \tag{2.6}
\end{equation*}
$$

Indeed, let us write equation (2.2) in radial coordinates as

$$
\begin{equation*}
-\frac{1}{r^{N-1}}\left(r^{N-1} v^{\prime}\right)^{\prime}=|v|^{\frac{4}{N-2}} v+\varepsilon|x|^{\alpha} v \quad r \in(0,1) \tag{2.7}
\end{equation*}
$$

Since $v$ is non-trivial, then $v(0) \neq 0$ and then, by continuity of $v$, the R.H.S. in (2.7) has a given sign near 0 . By (2.7) we deduce that the function $r^{N-1} v^{\prime}(r)$ is monotone in $r$ and then has limit as $r \rightarrow 0$ : $\lim _{r \rightarrow 0} r^{N-1} v^{\prime}(r)=l$. However, $l \neq 0$ would imply a discontinuity of $v$ at 0 , and then (2.6) is established.
Take $\epsilon>0$ and assume w.l.o.g. $v(0)>0$. Given $R$ so that $\lim _{r \rightarrow R} r^{N-1} v^{\prime}(r)=0$, observe that the integration of $(2.7)$ in $(R, r)$ gives

$$
\begin{equation*}
v^{\prime}(r)=-\frac{1}{r^{N-1}} \int_{R}^{r} s^{N-1}\left(|v|^{\frac{4}{N-2}} v+\epsilon s^{\alpha} v\right) d s \tag{2.8}
\end{equation*}
$$

for all $r>0$. Since $v(0)>0$ and $v^{\prime}<0$ near 0 in view of (2.8) with $R=0$, let us define

$$
R_{1}=\sup \left\{r \in(0,1): v>0 \text { in }\left(R_{0}, r\right)\right\}, \quad r_{2}=\sup \left\{r \in(0,1): v^{\prime}<0 \text { in }\left(r_{1}, r\right)\right\} .
$$

If $R_{1}=1$, then $r_{2}=1$ and the choice $k=1$ completes the proof. If $R_{1}<1$, by (2.8) with $R=0$ and $v(1)=0$ we deduce that $R_{1}<r_{2}<1, v^{\prime}\left(r_{2}\right)=0$ and

$$
v>v\left(R_{1}\right)=0 \text { in }\left(R_{0}, R_{1}\right), \quad v^{\prime}<v^{\prime}\left(r_{1}\right)=0 \text { in }\left(r_{1}, r_{2}\right) .
$$

In an iterative way, for $i \geq 2$ assume to have found $R_{0}=r_{1}=0<R_{1}<r_{2}<\cdots<R_{i-1}<r_{i}<1$ so that $v^{\prime}\left(r_{i}\right)=0$ and for all $j=1, \ldots, i-1$

$$
(-1)^{j-1} v>v\left(R_{j}\right)=0 \text { in }\left(R_{j-1}, R_{j}\right), \quad(-1)^{j} v^{\prime}>v^{\prime}\left(r_{j}\right)=0 \text { in }\left(r_{j}, r_{j+1}\right)
$$

Define
$R_{i}=\sup \left\{r \in(0,1):(-1)^{i-1} v>0\right.$ in $\left.\left(R_{i-1}, r\right)\right\}, \quad r_{i+1}=\sup \left\{r \in(0,1):(-1)^{i} v^{\prime}>0\right.$ in $\left.\left(r_{i}, r\right)\right\}$.

Since $(-1)^{i-1} v^{\prime}>0$ in $\left(r_{i-1}, r_{i}\right)$ and $R_{i-1} \in\left(r_{i-1}, r_{i}\right)$, we have that $r_{i}<R_{i} \leq 1$, and by (2.8) with $R=r_{i}$ it follows that $(-1)^{i} v^{\prime}>0$ in $\left(r_{i}, R_{i}\right]$. If $R_{i}=1$, then $r_{i+1}=1$ and the choice $k=i$ completes the proof. If $R_{i}<1$, the boundary condition $v(1)=0$ implies that $R_{i}<r_{i+1}<1$, which in turn leads to $v^{\prime}\left(r_{i+1}\right)=0$ and

$$
(-1)^{i-1} v>v\left(R_{i}\right)=0 \text { in }\left(R_{i-1}, R_{i}\right), \quad(-1)^{i} v^{\prime}>v^{\prime}\left(r_{i}\right)=0 \text { in }\left(r_{i}, r_{i+1}\right)
$$

Such a process needs to stop after $k$ steps. Otherwise, we would find an increasing sequence $R_{i}$, $i \in \mathbb{N}$, so that $v\left(R_{i}\right)=v\left(R_{i+1}\right)=0$. Letting $R=\lim _{i \rightarrow+\infty} R_{i} \in(0,1]$, we would have that $\lim _{i \rightarrow+\infty} r_{i}=$ $R$ in view of $R_{i-1}<r_{i}<R_{i}$. Since $v \in C^{2}(\bar{B} \backslash\{0\})$, we would deduce that $v(R)=v^{\prime}(R)=0$, and then by the uniqueness for the ODE $v=0$, a contradiction.
Finally, let us integrate (2.2) against $v$ on a nodal region $A$ to get

$$
\begin{aligned}
S\left(\int_{A}|v|^{\frac{2 N}{N-2}}\right)^{\frac{N-2}{N}} & \leq \int_{A}|\nabla v|^{2}=\int_{A}|v|^{\frac{2 N}{N-2}}+\epsilon \int_{A}|x|^{\alpha} v^{2} \\
& \leq \int_{A}|v|^{\frac{2 N}{N-2}}+\left.\left.\epsilon| | x\right|^{\alpha}\right|_{\frac{N}{2}}\left(\int_{A}|v|^{\frac{2 N}{N-2}}\right)^{\frac{N-2}{N}}
\end{aligned}
$$

thanks to the Hölder's inequality and to the embedding $\mathcal{D}^{1,2}\left(\mathbb{R}^{N}\right) \subset L^{\frac{2 N}{N-2}}\left(\mathbb{R}^{N}\right)$ with Sobolev constant $S$. Setting $\varepsilon_{0}=\frac{S}{\left.2| | x\right|^{\alpha}{ }_{\frac{N}{2}}}$, the validity of (2.3) easily follows for all $0<\varepsilon \leq \varepsilon_{0}$.
Let $v_{n} \in H_{0}^{1}(B)$ be a sequence of non-trivial radial solutions to (2.2) with $\alpha>-2$. Up to a subsequence, we can assume that there exist $k \geq 1$ and sequences $R_{0}^{n}=r_{1}^{n}=0<R_{1}^{n}<r_{2}^{n}<\cdots<$ $R_{k-1}^{n}<r_{k}^{n}<R_{k}^{n}=r_{k+1}^{n+1} \leq 1$ so that for all $j=1, \ldots, k$

$$
\begin{equation*}
(-1)^{j-1} v_{n}>v_{n}\left(R_{j}^{n}\right)=0 \quad \text { in }\left(R_{j-1}^{n}, R_{j}^{n}\right), \quad(-1)^{j} v_{n}^{\prime}>v_{n}^{\prime}\left(r_{j}^{n}\right)=0 \text { in }\left(r_{j}^{n}, r_{j+1}^{n}\right) \tag{2.9}
\end{equation*}
$$

Notice that such an assumption simply means that all the $v_{n}$ 's have at least $k$ nodal regions. The case of positive solutions $v_{n}$ corresponds to take $k=1$ and $R_{1}^{n}=1$, whereas for signchanging solutions we can always choose a subsequence with at least $k \geq 2$ nodal regions. Set $\delta_{j}^{n}=\left|v_{n}\left(r_{j}^{n}\right)\right|^{-\frac{2}{N-2}}$, where

$$
\begin{equation*}
\left|v_{n}\right|\left(r_{j}^{n}\right)=\max _{\left[R_{j-1}^{n}, R_{j}^{n}\right]}\left|v_{n}\right| \tag{2.10}
\end{equation*}
$$

Blow-up phenomena for (2.2) are described in terms of the limiting problem

$$
\begin{equation*}
-\Delta V=V^{\frac{N+2}{N-2}} \text { in } \mathbb{R}^{N} \tag{2.11}
\end{equation*}
$$

whose bounded solutions are completely classified [4, 21]. In particular, every radial positive and bounded solution of (2.11) is given by

$$
\begin{equation*}
V_{\delta}(x)=\delta^{-\frac{N-2}{2}} V\left(\frac{x}{\delta}\right)=\left(\frac{\delta}{\delta^{2}+a_{N}|x|^{2}}\right)^{\frac{N-2}{2}} \tag{2.12}
\end{equation*}
$$

for some $\delta>0$, where $a_{N}=\frac{1}{N(N-2)}$ and

$$
\begin{equation*}
V(x)=\left(\frac{1}{1+a_{N}|x|^{2}}\right)^{\frac{N-2}{2}} \tag{2.13}
\end{equation*}
$$

The asymptotic behavior of $v_{n}$ is described in the following main result:
Theorem 2.2. As $n \rightarrow+\infty$ there hold

$$
\begin{equation*}
\frac{r_{j}^{n}}{\delta_{j}^{n}} \rightarrow 0, \quad \frac{R_{j}^{n}}{\delta_{j}^{n}} \rightarrow+\infty, \quad V_{j}^{n}(x)=(-1)^{j-1}\left(\delta_{j}^{n}\right)^{\frac{N-2}{2}} v_{n}\left(\delta_{j}^{n} x\right) \rightarrow V \text { in } C_{l o c}^{1}\left(\mathbb{R}^{N} \backslash\{0\}\right) \tag{2.14}
\end{equation*}
$$

for all $j=1, \ldots, k$. Moreover, $\alpha \leq N-4$ if $k=1$ and $\alpha<\frac{N-6}{2}$ if $k \geq 2$. If in addition

$$
\begin{equation*}
R_{k-1}^{n} \rightarrow 0 \text { and } R_{k}^{n} \rightarrow R_{k}>0 \tag{2.15}
\end{equation*}
$$

as $n \rightarrow+\infty$, there hold $R_{k}^{n}=1$ and for all $j=1, \ldots k-1$

$$
\begin{align*}
& R_{j}^{n} \sim\left[\frac{\int_{\mathbb{R}^{N}} V^{\frac{N+2}{N-2}}}{(N-2) \omega_{N-1}}\right]^{\frac{1}{N-2}} \sqrt{\delta_{j}^{n} \delta_{j+1}^{n}}  \tag{2.16}\\
& \delta_{j}^{n} \sim\left[\frac{(\alpha+2) \int_{\mathbb{R}^{N}}|x|^{\alpha} V^{2}}{(N-2) \int_{\mathbb{R}^{N}} V^{\frac{N+2}{N-2}}} \varepsilon_{n}\right]^{\frac{(N-2)\left(\frac{N-2}{N-6-2 \alpha}\right)^{k-j}-(N-4-\alpha)}{(2+\alpha)(N-4-\alpha)}}\left[\frac{(N-2) \omega_{N-1}}{\int_{\mathbb{R}^{N}} V^{\frac{N+2}{N-2}}}\right]^{\frac{1}{N-4-\alpha}\left(\frac{N-2}{N-6-2 \alpha}\right)^{k-j}} \\
& \delta_{k}^{n} \sim\left[\frac{(\alpha+2) \omega_{N-1} \int_{\mathbb{R}^{N}}|x|^{\alpha} V^{2}}{\left(\int_{\mathbb{R}^{N}} V^{\frac{N+2}{N-2}}\right)^{2}} \varepsilon_{n}\right]^{\frac{1}{N-4-\alpha}}
\end{align*}
$$

as $n \rightarrow+\infty$ provided $\alpha<N-4$.
Asymptotics for radial least-energy sign-changing solutions of (2.2) with $\alpha=0$ and $N \geq 7$ has been already considered in [23] and corresponds to the case $k=2$. Here we develop the asymptotic analysis in a completely general way by refining the results in [23] for $k=2$, by covering the situation $\alpha \neq 0$ and including the case $k \geq 3$. Several new difficulties arise:

- in each nodal region $v_{n}$ might develop multiple bubbles, but the Pohozaev identity will show crucial to prevent the interaction between bubbles of same sign;
- the limiting problem admits positive radial solutions also on annuli or complements of balls, but none of them can be limit of $V_{j}^{n}$, as we will prove by a matching condition on $v_{n}^{\prime}\left(R_{j}^{n}\right)$ as computed from the left and the right;
- the precise law of $\delta_{j}^{n}$ is prescribed by the Pohozaev identity in terms of $\varepsilon_{n}$ and $R_{j}^{n}$, but the asymptotic behavior of $R_{j}^{n}$ has to be determined according to a tricky compatibility condition between $v_{n}^{\prime}\left(R_{j}^{n}\right)$ and $v_{n}\left(r_{j}^{n}\right)$.
Given $\Gamma$ in (1.5), let

$$
\begin{equation*}
\sigma_{j}=\frac{1}{2} \frac{\Gamma}{\Gamma-1}\left(\frac{\Gamma}{\Gamma-2}\right)^{j-1}-\frac{1}{2} \tag{2.17}
\end{equation*}
$$

For $\mu=[\sqrt{N(N-2)} \delta]^{\frac{N-2}{2 \Gamma}}$, notice that the solution $U_{\mu}$ of (1.6) given by (1.3) corresponds through (2.1) to the solution $V_{\delta}$ of (2.11) given by (2.12). Setting $M_{k-j+1}^{n}=\left(R_{j}^{n}\right)^{\frac{2 \Gamma}{N-2}}$ and $\mu_{j}^{n}=\left[\sqrt{N(N-2)} \delta_{k-j+1}^{n}\right]^{\frac{N-2}{2 \Gamma}}$, by Theorem 2.2 with $\alpha=\frac{N-2}{\Gamma}-2$ we deduce the following:
Corollary 2.3. Let $u_{n}$ be a sequence of radial solutions for (1.7) in $B$ with $\varepsilon_{n} \rightarrow 0^{+}$as $n \rightarrow+\infty$.
(i) If $u_{n}$ are positive functions, then $\gamma \leq \frac{(N-2)^{2}}{4}-1$ and

$$
\mu_{1}^{n}=d_{1} \varepsilon_{n}^{\sigma_{1}}(1+o(1)), \quad U_{1}^{n}(x)=\left(\mu_{1}^{n}\right)^{\frac{N-2}{2}} u_{n}\left(\mu_{1}^{n} x\right) \rightarrow U \text { in } C_{l o c}^{1}\left(\mathbb{R}^{N} \backslash\{0\}\right)
$$

as $n \rightarrow+\infty$ when $\gamma<\frac{(N-2)^{2}}{4}-1$.
(ii) If $u_{n}$ are sign-changing solutions, then $\gamma<\frac{(N-2)^{2}}{4}-4$.
(iii) If $u_{n}$ have precisely $k-1$ shrinking nodal regions with nodes

$$
0=M_{k+1}^{n}<M_{k}^{n}<\cdots<M_{2}^{n} \rightarrow 0, \quad M_{1}^{n} \rightarrow M_{1} \in(0,1]
$$

as $n \rightarrow+\infty$, then there exist $\mu_{j}^{n}>0, j=1, \ldots, k$, so that as $n \rightarrow+\infty$ :

$$
\mu_{j}^{n}=d_{j} \varepsilon_{n}^{\sigma_{j}}(1+o(1)), \quad U_{j}^{n}(x)=\left(\mu_{j}^{n}\right)^{\frac{N-2}{2}} u_{n}\left(\mu_{j}^{n} x\right) \rightarrow U \text { in } C_{l o c}^{1}\left(\mathbb{R}^{N} \backslash\{0\}\right)
$$

for all $j=1, \ldots, k$ and

$$
M_{1}^{n}=1, \quad M_{j}^{n}=A\left(\mu_{j-1}^{n} \mu_{j}^{n}\right)^{\frac{2 \Gamma}{(N-2)^{2}}}(1+o(1))
$$

for all $j=2, \ldots, k$.
Here $U$ is given in (1.4) and $A, d_{j}>0$ are explicit constants.

Let us discuss first the behavior of $v_{n}$ in $\left(0, R_{1}^{n}\right)$. Notice that the function $V_{1}^{n}=\left(\delta_{1}^{n}\right)^{\frac{N-2}{2}} v_{n}\left(\delta_{1}^{n} x\right)$ solves

$$
\begin{cases}-\Delta V_{1}^{n}=\left(V_{1}^{n}\right)^{\frac{N+2}{N-2}}+\varepsilon_{n}\left(\delta_{1}^{n}\right)^{2+\alpha}|x|^{\alpha} V_{1}^{n} & \text { in } B_{\frac{R_{n}^{n}}{\delta_{1}^{n}}}(0) \\ 0<V_{1}^{n} \leq V_{1}^{n}(0)=1 & \text { in } B_{\frac{R_{n}^{n}}{\delta_{1}^{n}}}(0)\end{cases}
$$

in view of

$$
\begin{equation*}
0<(-1)^{j-1} v_{n} \leq(-1)^{j-1} v_{n}\left(r_{j}^{n}\right)=\frac{1}{\left(\delta_{j}^{n}\right)^{\frac{N-2}{2}}} \quad \text { in }\left(R_{j-1}^{n}, R_{j}^{n}\right) \tag{2.18}
\end{equation*}
$$

a simple re-writing of (2.10) through (2.9). By elliptic estimates we deduce that $V_{1}^{n}$ is uniformly bounded in $C_{\operatorname{loc}}^{0, \gamma}\left(\mathbb{R}^{N}\right) \cap C_{\operatorname{loc}}^{1, \gamma}\left(\mathbb{R}^{N} \backslash\{0\}\right), \gamma \in(0,1)$, in view of (2.4). By the Ascoli-Arzelá's Theorem and a diagonal process, we have that, up to a subsequence, $V_{1}^{n} \rightarrow V$ in $C_{\operatorname{loc}}\left(\mathbb{R}^{N}\right) \cap C_{\operatorname{loc}}^{1}\left(\mathbb{R}^{N} \backslash\{0\}\right)$, where $V$ solves

$$
-\Delta V=V^{\frac{N+2}{N-2}} \text { in } \mathbb{R}^{N}, \quad 0<V \leq V(0)=1 \text { in } \mathbb{R}^{n}
$$

and has the form (2.13) [4, 21]. We have used that

$$
\begin{equation*}
\frac{R_{1}^{n}}{\delta_{1}^{n}} \rightarrow+\infty \tag{2.19}
\end{equation*}
$$

as $n \rightarrow+\infty$. Indeed, if $\frac{\delta_{1}^{n}}{R_{1}^{n}}$ were bounded away from zero, then $\tilde{V}_{1}^{n}(x)=\left(R_{1}^{n}\right)^{\frac{N-2}{2}} v_{n}\left(R_{1}^{n} x\right)$ would be uniformly bounded in $B$ in view of (2.18). Since $\tilde{V}_{1}^{n}>0$ solves

$$
-\Delta \tilde{V}_{1}^{n}=\left(\tilde{V}_{1}^{n}\right)^{\frac{N+2}{N-2}}+\varepsilon_{n}\left(R_{1}^{n}\right)^{2+\alpha}|x|^{\alpha} \tilde{V}_{1}^{n} \text { in } B, \quad \tilde{V}_{1}^{n}=0 \text { on } \partial B
$$

by elliptic estimates, as before, we would deduce that, up to a subsequence, $\tilde{V}_{1}^{n} \rightarrow \tilde{V}_{1}$ in $C(\bar{B}) \cap$ $C_{\text {loc }}^{1}(\bar{B} \backslash\{0\})$, where $\tilde{V}_{1} \geq 0$ is a bounded solution of

$$
-\Delta \tilde{V}_{1}=\left(\tilde{V}_{1}\right)^{\frac{N+2}{N-2}} \text { in } B \backslash\{0\}, \quad \tilde{V}_{1}=0 \text { on } \partial B .
$$

Let us recall the Pohozaev identity [28] in a radial form: given a solution $v$ of (2.2) and a radial domain $A \subset B$, multiply (2.2) by $\langle x, \nabla v\rangle=|x| v^{\prime}$ and integrate in $A$ to get

$$
\begin{equation*}
(\alpha+2) \varepsilon \int_{A}|x|^{\alpha} v^{2}=\int_{\partial A}\left[\left(v^{\prime}\right)^{2}+\frac{N-2}{|x|} v v^{\prime}+\frac{N-2}{N}|v|^{\frac{2 N}{N-2}}+\varepsilon|x|^{\alpha} v^{2}\right]\langle x, \nu\rangle . \tag{2.20}
\end{equation*}
$$

Since 0 is a removable singularity in view of $\tilde{V}_{1} \in L^{\infty}(\{0\})$, by (2.20) with $\epsilon=0$ on $A=B$ we would get that $\tilde{V}_{1}=0$ and then

$$
\int_{B}\left|\tilde{V}_{1}^{n}\right|^{\frac{2 N}{N-2}} \rightarrow 0
$$

as $n \rightarrow+\infty$, in contradiction with (2.3) in view of $\varepsilon_{n}\left(R_{1}^{n}\right)^{2+\alpha} \rightarrow 0$ as $n \rightarrow+\infty$.
We aim to show that there is no superposition of bubbles of same sign in $\left[0, R_{1}^{n}\right]$. Interaction between bubbles of same sign can be ruled out by the Pohozaev identity (2.20). Letting

$$
\begin{equation*}
J=\{j=1, \ldots, k:(2.14) \text { holds }\} \tag{2.21}
\end{equation*}
$$

notice that $1 \in J$ according to (2.19). We have the following general result:
Proposition 2.4. There exists $C>0$ so that

$$
\begin{equation*}
\left|v_{n}\right| \leq C V_{\delta_{j}^{n}} \quad \text { in }\left[R_{j-1}^{n}, R_{j}^{n}\right] \tag{2.22}
\end{equation*}
$$

for all $j \in J$, where $V_{\delta}$ is given by (2.12).
Proof. The presence of other bubbles in $\left[R_{j-1}^{n}, R_{j}^{n}\right]$ can be detected by the behavior of $r^{\frac{N-2}{2}} v_{n}(r)$. Notice that the function $r^{\frac{N-2}{2}} V(r)=\left(\frac{r}{1+a_{N} r^{2}}\right)^{\frac{N-2}{2}}$ satisfies

$$
\begin{equation*}
\left.r^{\frac{N-2}{2}} V\right|_{r=a_{N}^{-\frac{1}{2}}}=\left(\frac{N(N-2)}{4}\right)^{\frac{N-2}{4}}, \quad \lim _{r \rightarrow+\infty} r^{\frac{N-2}{2}} V(r)=0 \tag{2.23}
\end{equation*}
$$

and

$$
\begin{equation*}
\left[r^{\frac{N-2}{2}} V(r)\right]^{\prime}=\frac{N-2}{2} \frac{r^{\frac{N-4}{2}}\left(1-a_{N} r^{2}\right)}{\left(1+a_{N} r^{2}\right)^{\frac{N}{2}}}<0 \text { in }\left(a_{N}^{-\frac{1}{2}},+\infty\right) \tag{2.24}
\end{equation*}
$$

Thanks to (2.23) let us fix $M>a_{N}^{-\frac{1}{2}}$ so that

$$
\begin{equation*}
M^{\frac{N-2}{2}} V(M)=\min \left\{\left[\frac{N(N-2)}{16}\right]^{\frac{N-2}{4}},\left[\frac{(N-2)^{2}(N+1)}{2(N+2)^{2}}\right]^{\frac{N-2}{4}}\right\} \tag{2.25}
\end{equation*}
$$

We claim that for $n$ large

$$
\begin{equation*}
(-1)^{j-1}\left[r^{\frac{N-2}{2}} v_{n}\right]^{\prime}<0 \text { in }\left[M \delta_{j}^{n}, R_{j}^{n}\right] \tag{2.26}
\end{equation*}
$$

Indeed, if (2.26) were not true, we could find $M_{n} \in\left[M \delta_{j}^{n}, R_{j}^{n}\right]$ so that

$$
\begin{equation*}
(-1)^{j-1}\left[r^{\frac{N-2}{2}} v_{n}\right]^{\prime}<\left[r^{\frac{N-2}{2}} v_{n}\right]^{\prime}\left(M_{n}\right)=0 \text { in }\left[M \delta_{j}^{n}, M_{n}\right), \quad \frac{M_{n}}{\delta_{j}^{n}} \rightarrow 0 \text { as } n \rightarrow+\infty \tag{2.27}
\end{equation*}
$$

as it follows by (2.24) and

$$
(-1)^{j-1} \delta_{j}^{n}\left[r^{\frac{N-2}{2}} v_{n}\right]^{\prime}\left(r \delta_{j}^{n}\right)=\left[r^{\frac{N-2}{2}} V_{j}^{n}\right]^{\prime} \rightarrow\left[r^{\frac{N-2}{2}} V\right]^{\prime}
$$

locally uniformly in $(0,+\infty)$ as $n \rightarrow+\infty$ in view of (2.14). By (2.20) applied to $v_{n}$ on $A=B_{M_{n}}(0)$ we get that

$$
\begin{equation*}
\left[\frac{M_{n} v_{n}^{\prime}\left(M_{n}\right)}{v_{n}\left(M_{n}\right)}\right]^{2}+(N-2) \frac{M_{n} v_{n}^{\prime}\left(M_{n}\right)}{v_{n}\left(M_{n}\right)}+\frac{N-2}{N} M_{n}^{2}\left|v_{n}\left(M_{n}\right)\right|^{\frac{4}{N-2}}+\varepsilon_{n} M_{n}^{2+\alpha}>0 \tag{2.28}
\end{equation*}
$$

in view of $\alpha>-2$. Since by (2.27)

$$
M_{n} v_{n}^{\prime}\left(M_{n}\right)=-\frac{N-2}{2} v_{n}\left(M_{n}\right)
$$

we deduce that

$$
-\frac{(N-2)^{2}}{4}+\frac{N-2}{N} M_{n}^{2}\left|v_{n}\left(M_{n}\right)\right|^{\frac{4}{N-2}}+\varepsilon_{n} M_{n}^{2+\alpha}>0
$$

Since

$$
(-1)^{j-1} M_{n}^{\frac{N-2}{2}} v_{n}\left(M_{n}\right) \leq(-1)^{j-1}\left(M \delta_{j}^{n}\right)^{\frac{N-2}{2}} v_{n}\left(M \delta_{j}^{n}\right)=M^{\frac{N-2}{2}} V_{j}^{n}(M) \rightarrow M^{\frac{N-2}{2}} V(M)
$$

as $n \rightarrow+\infty$ in view of (2.14) and (2.27), by (2.25) we deduce that

$$
-\frac{(N-2)^{2}}{4}+\frac{N-2}{N} M_{n}^{2}\left|v_{n}\left(M_{n}\right)\right|^{\frac{4}{N-2}}+\varepsilon_{n} M_{n}^{2+\alpha} \leq-\frac{(N-2)^{2}}{8}+\varepsilon_{n}<0
$$

for $n$ large, a contradiction with (2.28). The claim (2.26) is established.
Once (2.26) is established, we can prove the validity of (2.22). First, since $(-1)^{j-1} v_{n}$ is a positive solution of $L_{n} v_{n}=0$ in $\left[R_{j-1}^{n}, R_{j}^{n}\right]$, the operator $L_{n}=-\Delta-\left|v_{n}\right|^{\frac{4}{N-2}}-\varepsilon_{n}|x|^{\alpha}$ satisfies the minimum principle in $\left[R_{j-1}^{n}, R_{j}^{n}\right]$, and we can compare $(-1)^{j-1} v_{n}$ with $\varphi_{n}=\frac{M^{\frac{(N-2)(N+1)}{N+2}\left(\delta_{j}^{n}\right)^{\frac{N(N-2)}{2(N+2)}}}}{r^{\frac{(N-2)(N+1)}{N+2}}}$ in $\left[M \delta_{j}^{n}, R_{j}^{n}\right]$. Since

$$
\begin{aligned}
L_{n} \varphi_{n} & =M^{\frac{(N-2)(N+1)}{N+2}}\left(\delta_{j}^{n}\right)^{\frac{N(N-2)}{2(N+2)}} r^{-\frac{N^{2}+N+2}{N+2}}\left[\frac{(N-2)^{2}(N+1)}{(N+2)^{2}}-r^{2}\left|v_{n}(r)\right|^{\frac{4}{N-2}}-\varepsilon_{n} r^{2+\alpha}\right] \\
& \geq M^{\frac{(N-2)(N+1)}{N+2}}\left(\delta_{j}^{n}\right)^{\frac{N(N-2)}{2(N+2)}} r^{-\frac{N^{2}+N+2}{N+2}}\left[\frac{(N-2)^{2}(N+1)}{(N+2)^{2}}-M^{2}\left|V_{j}^{n}(M)\right|^{\frac{4}{N-2}}-\varepsilon_{n}\right]
\end{aligned}
$$

in $\left[M \delta_{j}^{n}, R_{j}^{n}\right]$ in view of (2.26), we have that $L_{n} \varphi_{n}>0$ in $\left[M \delta_{j}^{n}, R_{j}^{n}\right]$ for $n$ large in view of (2.14) and (2.25). Since

$$
(-1)^{j-1} v_{n}\left(M \delta_{j}^{n}\right) \leq \frac{1}{\left(\delta_{j}^{n}\right)^{\frac{N-2}{2}}}=\varphi_{n}\left(M \delta_{j}^{n}\right), \quad(-1)^{j-1} v_{n}\left(R_{j}^{n}\right)=0<\varphi_{n}\left(R_{j}^{n}\right)
$$

in view of (2.18), we have that

$$
\left|v_{n}\right|(r)=(-1)^{j-1} v_{n}(r) \leq \frac{M^{\frac{(N-2)(N+1)}{N+2}}\left(\delta_{j}^{n}\right)^{\frac{N(N-2)}{2(N+2)}}}{r^{\frac{(N-2)(N+1)}{N+2}}} \quad \text { in }\left[M \delta_{j}^{n}, R_{j}^{n}\right]
$$

or equivalently

$$
\begin{equation*}
V_{j}^{n}(r) \leq \frac{M^{\frac{(N-2)(N+1)}{N+2}}}{r^{\frac{(N-2)(N+1)}{N+2}}} \quad \text { in }\left[M, \frac{R_{j}^{n}}{\delta_{j}^{n}}\right] \tag{2.29}
\end{equation*}
$$

By (2.8) with $R=r_{j}^{n}$ we get that in $\left[R_{j-1}^{n}, R_{j}^{n}\right]$

$$
\begin{align*}
(-1)^{j} v_{n}^{\prime}(r) & =\frac{1}{r^{N-1}} \int_{r_{j}^{n}}^{r} s^{N-1}\left(\left|v_{n}\right|^{\frac{N+2}{N-2}}+\epsilon_{n} s^{\alpha}\left|v_{n}\right|\right) d s \\
& =\frac{\left(\delta_{j}^{n}\right)^{\frac{N-2}{2}}}{r^{N-1}} \int_{\frac{r_{j}^{n}}{\delta_{j}^{n}}}^{\frac{r}{\delta_{j}^{n}}} s^{N-1}\left(V_{j}^{n}\right)^{\frac{N+2}{N-2}}+\frac{\epsilon_{n}}{r^{N-1}} \int_{r_{j}^{n}}^{r} s^{N-1+\alpha}\left|v_{n}\right| d s \tag{2.30}
\end{align*}
$$

Inserting (2.29) into (2.30) we deduce that

$$
\begin{aligned}
\left|v_{n}^{\prime}(r)\right| \leq & \frac{\left(\delta_{j}^{n}\right)^{\frac{N-2}{2}}}{r^{N-1}}\left[\frac{M^{N}}{N}+M^{N+1} \int_{M}^{\infty} \frac{1}{s^{2}}\right] \\
& +\frac{\epsilon_{n}}{r^{N-1}}\left[\frac{M^{N+\alpha}}{N+\alpha}\left(\delta_{j}^{n}\right)^{\alpha+\frac{N+2}{2}}+\frac{1}{\alpha+2} \sup _{\left[M \delta_{j}^{n}, R_{j}^{n}\right]} r^{N-2}\left|v_{n}\right|(r)\right] \\
\leq & \frac{C}{r^{N-1}}\left[\left(\delta_{j}^{n}\right)^{\frac{N-2}{2}}+\epsilon_{n} \sup _{\left[M \delta_{j}^{n}, R_{j}^{n}\right]} r^{N-2}\left|v_{n}\right|(r)\right]
\end{aligned}
$$

for $M \delta_{j}^{n} \leq r \leq R_{j}^{n}$ in view of (2.18) and $\alpha+\frac{N+2}{2}>\frac{N-2}{2}$. Integrating in $\left[r, R_{j}^{n}\right]$ we get that

$$
r^{N-2}\left|v_{n}(r)\right| \leq r^{N-2} \int_{r}^{R_{j}^{n}}\left|v_{n}^{\prime}\right| \leq C\left(\delta_{j}^{n}\right)^{\frac{N-2}{2}}
$$

in $\left[M \delta_{j}^{n}, R_{j}^{n}\right]$, and then

$$
\begin{equation*}
\left|v_{n}\right|(r) \leq C \frac{\left(\delta_{j}^{n}\right)^{\frac{N-2}{2}}}{r^{N-2}} \leq C V_{\delta_{j}^{n}} \quad \text { in }\left[M \delta_{j}^{n}, R_{j}^{n}\right] \tag{2.31}
\end{equation*}
$$

for $n$ large. By (2.18) there holds that

$$
\left|v_{n}\right| \leq \frac{1}{\left(\delta_{j}^{n}\right)^{\frac{N-2}{2}}} \leq C V_{\delta_{j}^{n}} \quad \text { in }\left[R_{j-1}^{n}, M \delta_{j}^{n}\right]
$$

which, combined with (2.31), completes the proof.
Thanks to Proposition 2.4 we are now in position to establish Theorem 2.2.
Proof (of Theorem 2.2). Let $j \in J, J$ given in (2.21), so that Proposition 2.4 applies. By (2.18) and (2.31) we deduce that

$$
\begin{equation*}
\varepsilon_{n} \int_{r_{j}^{n}}^{R_{j}^{n}} s^{N-1+\alpha}\left|v_{n}\right| d s=O\left(\varepsilon_{n}\left(\delta_{j}^{n}\right)^{\alpha+\frac{N+2}{2}}+\varepsilon_{n}\left(\delta_{j}^{n}\right)^{\frac{N-2}{2}}\right)=o\left(\left(\delta_{j}^{n}\right)^{\frac{N-2}{2}}\right) \tag{2.32}
\end{equation*}
$$

as $n \rightarrow+\infty$ in view of $\alpha+\frac{N+2}{2}>\frac{N-2}{2}$, and (2.22) can be re-written as

$$
\begin{equation*}
\left|V_{j}^{n}\right| \leq C V \quad \text { in }\left[\frac{R_{j-1}^{n}}{\delta_{j}^{n}}, \frac{R_{j}^{n}}{\delta_{j}^{n}}\right] \tag{2.33}
\end{equation*}
$$

Inserting (2.32) into (2.30), by the Lebesgue's Theorem we have that

$$
\begin{equation*}
(-1)^{j}\left(\delta_{j}^{n}\right)^{-\frac{N-2}{2}}\left(R_{j}^{n}\right)^{N-1} v_{n}^{\prime}\left(R_{j}^{n}\right) \rightarrow \int_{0}^{\infty} s^{N-1} V^{\frac{N+2}{N-2}} \tag{2.34}
\end{equation*}
$$

for all $j \in J$ as $n \rightarrow+\infty$, in view of $V_{j}^{n} \rightarrow V$ in $C_{\mathrm{loc}}\left(\mathbb{R}^{N} \backslash\{0\}\right)$ and (2.33).
Since $1 \in J$, let us apply (2.20) to $v_{n}$ on $B_{R_{1}^{n}}(0)$ if $j=1$ or on $B_{R_{j}^{n}}(0) \backslash B_{R_{j-1}^{n}}(0)$ if $j \geq 2$ with $j-1, j \in J$. As $n \rightarrow+\infty$ we get that

$$
\begin{align*}
& (\alpha+2) \varepsilon_{n} \int_{R_{j-1}^{n}}^{R_{j}^{n}} r^{N-1+\alpha} v_{n}^{2}=\left(R_{j}^{n}\right)^{N}\left(v_{n}^{\prime}\left(R_{j}^{n}\right)\right)^{2}-\left(R_{j-1}^{n}\right)^{N}\left(v_{n}^{\prime}\left(R_{j-1}^{n}\right)\right)^{2} \\
& =\left(\int_{0}^{\infty} r^{N-1} V^{\frac{N+2}{N-2}}\right)^{2}\left[\left(\frac{\delta_{j}^{n}}{R_{j}^{n}}\right)^{N-2}(1+o(1))-\left(\frac{\delta_{j-1}^{n}}{R_{j-1}^{n}}\right)^{N-2}(1+o(1))\right] \tag{2.35}
\end{align*}
$$

in view of (2.34), with the convention $\frac{\delta_{0}^{n}}{R_{0}^{n}}=0$. The LHS above has the following asymptotic behavior: if $\alpha>N-4$ there holds

$$
\begin{equation*}
\int_{R_{j-1}^{n}}^{R_{j}^{n}} r^{N-1+\alpha} v_{n}^{2} \leq C^{2}[N(N-2)]^{N-2}\left(\delta_{j}^{n}\right)^{N-2} \int_{R_{j-1}^{n}}^{R_{j}^{n}} r^{3+\alpha-N}=O\left(\left(\delta_{j}^{n}\right)^{N-2}\right) \tag{2.36}
\end{equation*}
$$

in view of (2.22); if $-2<\alpha \leq N-4$ there holds

$$
\begin{align*}
\int_{R_{j-1}^{n}}^{R_{j}^{n}} r^{N-1+\alpha} v_{n}^{2} & =\left(\delta_{j}^{n}\right)^{2+\alpha} \int_{\frac{R_{j-1}^{n}}{\delta_{j}^{n}}}^{\frac{R_{j}^{n}}{\delta_{j}^{n}}} r^{N-1+\alpha}\left(V_{j}^{n}\right)^{2} \\
& = \begin{cases}\left(\delta_{j}^{n}\right)^{2+\alpha} \int_{0}^{+\infty} r^{N-1+\alpha} V^{2}(1+o(1)) & \text { if } \alpha<N-4 \\
O\left(\left(\delta_{j}^{n}\right)^{N-2}\left|\log \frac{R_{j}^{n}}{\delta_{j}^{n}}\right|\right) & \text { if } \alpha=N-4\end{cases} \tag{2.37}
\end{align*}
$$

in view of (2.14), (2.33) and the Lebesgue's Theorem.
We have some useful properties to establish.
$1^{\text {st }}$ Claim: We have that

$$
\begin{equation*}
j-1 \in J, \quad R_{j-1}^{n}<1 \Rightarrow \max _{\left[R_{j-1}^{n}, R_{j}^{n}\right]}\left|v_{n}\right| \rightarrow+\infty \text { as } n \rightarrow+\infty \tag{2.38}
\end{equation*}
$$

Up to a subsequence, assume that $R_{j-1}^{n} \rightarrow R_{j-1}$ and $R_{j}^{n} \rightarrow R_{j}$ as $n \rightarrow+\infty$. If $\max _{\left[R_{j-1}^{n}, R_{j}^{n}\right]}\left|v_{n}\right| \leq C$, by $\varepsilon_{n} \rightarrow 0$ as $n \rightarrow+\infty$, (2.3) and elliptic estimates we deduce that $R_{j-1}<R_{j}$ and, up to a subsequence, $(-1)^{j-1} v_{n} \rightarrow v$ in $C_{\operatorname{loc}}^{2}(A), A=B_{R_{j}}(0) \backslash \overline{B_{R_{j-1}}(0)}$, as $n \rightarrow+\infty$, where $v>0$ is a bounded solution of

$$
\begin{equation*}
-\Delta v=v^{\frac{N+2}{N-2}} \text { in } A, \quad v=0 \text { on } \partial A \backslash\{0\} \tag{2.39}
\end{equation*}
$$

We have that $R_{j-1}>0$, since otherwise $v$ would be a solution of (2.39) in the whole $B_{R_{j}}(0)$, 0 being a removable singularity, and then would vanish by the Pohozaev identity (2.20). Up to a subsequence, by elliptic estimates $\tilde{v}_{n}(r)=(-1)^{j-1}\left(R_{j-1}^{n}\right)^{\frac{N-2}{2}} v_{n}\left(r R_{j-1}^{n}\right) \rightarrow \tilde{v}$ in $C_{\text {loc }}^{2}(A)$, $A=B \frac{R_{j}}{R_{j-1}}(0) \backslash B$, as $n \rightarrow+\infty$, where $\tilde{v}>0$ is a bounded solution of

$$
-\Delta \tilde{v}=\tilde{v}^{\frac{N+2}{N-2}} \text { in } A, \quad \tilde{v}=0 \text { on } \partial A
$$

In particular, $\tilde{v}_{n}^{\prime}(1)=(-1)^{j-1}\left(R_{j-1}^{n}\right)^{\frac{N}{2}} v_{n}^{\prime}\left(R_{j-1}^{n}\right) \rightarrow \tilde{v}^{\prime}(1)>0$, in contradiction with (2.34) when $j-1 \in J$ and $R_{j-1}^{n} \rightarrow R_{j-1}>0$ as $n \rightarrow+\infty$. Then (2.38) is established and the Claim is proved.
$\underline{2}^{\text {nd }}$ Claim: We have that

$$
\begin{equation*}
j-1 \in J, R_{j-1}^{n}<1 \Rightarrow \sup \frac{r_{j}^{n}}{\delta_{j}^{n}}<+\infty \tag{2.40}
\end{equation*}
$$

If $\frac{r_{j}^{n}}{\delta_{j}^{n}} \rightarrow+\infty$ as $n \rightarrow+\infty$, then $j \geq 2$ and the function $\tilde{V}_{j}^{n}(r)=(-1)^{j-1}\left(\delta_{j}^{n}\right)^{\frac{N-2}{2}} v_{n}\left(r_{j}^{n}+\delta_{j}^{n} r\right)$ solves

$$
\begin{cases}-\left(\tilde{V}_{j}^{n}\right)^{\prime \prime}-(N-1) \frac{\delta_{j}^{n}}{r_{j}^{n}+\delta_{j}^{n} r}\left(\tilde{V}_{j}^{n}\right)^{\prime}=\left(\tilde{V}_{j}^{n}\right)^{\frac{N+2}{N-2}}+\varepsilon_{n}\left(\delta_{j}^{n}\right)^{2}\left(r_{j}^{n}+\delta_{j}^{n} r\right)^{\alpha} \tilde{V}_{j}^{n} & \text { in } I_{n}=\left(-\frac{r_{j}^{n}-R_{j-1}^{n}}{\delta_{j}^{n}}, \frac{R_{j}^{n}-r_{j}^{n}}{\delta_{j}^{n}}\right) \\ 0<\tilde{V}_{j}^{n} \leq \tilde{V}_{j}^{n}(0)=1 & \text { in } I_{n} \\ \tilde{V}_{j}^{n}=0 & \text { on } \partial I_{n}\end{cases}
$$

in view of (2.18). Up to a subsequence, assume that

$$
\frac{r_{j}^{n}-R_{j-1}^{n}}{\delta_{j}^{n}} \rightarrow L_{1} \in[0,+\infty], \quad \frac{R_{j}^{n}-r_{j}^{n}}{\delta_{j}^{n}} \rightarrow L_{2} \in[0,+\infty]
$$

as $n \rightarrow+\infty$. As we will justify later, we have that

$$
\begin{equation*}
L_{1}, L_{2}>0 \tag{2.41}
\end{equation*}
$$

Notice that

$$
\begin{equation*}
\left(\delta_{j}^{n}\right)^{2}\left(r_{j}^{n}+\delta_{j}^{n} r\right)^{\alpha}=\left(\frac{\delta_{j}^{n}}{r_{j}^{n}+\delta_{j}^{n} r}\right)^{2}\left(r_{j}^{n}+\delta_{j}^{n} r\right)^{2+\alpha} \leq\left(\frac{\delta_{j}^{n}}{r_{j}^{n}+\delta_{j}^{n} r}\right)^{2} \rightarrow 0 \tag{2.42}
\end{equation*}
$$

as $n \rightarrow+\infty$ in $C_{\mathrm{loc}}\left(-L_{1}, L_{2}\right)$, in view of $\frac{r_{j}^{n}}{\delta_{j}^{n}} \rightarrow+\infty$ as $n \rightarrow+\infty$. Up to a subsequence, by elliptic estimates we have that $\tilde{V}_{j}^{n} \rightarrow \tilde{V}_{j}$ in $C_{\mathrm{loc}}^{1}\left(-L_{1}, L_{2}\right)$, where $\tilde{V}_{j}$ is a solution of

$$
\begin{cases}-\left(\tilde{V}_{j}\right)^{\prime \prime}=\left(\tilde{V}_{j}\right)^{\frac{N+2}{N-2}} & \text { in }\left(-L_{1}, L_{2}\right) \\ 0<\tilde{V}_{j} \leq \tilde{V}_{j}(0)=1 & \text { in }\left(-L_{1}, L_{2}\right)\end{cases}
$$

Since by energy conservation there holds

$$
\frac{N}{N-2}\left(\tilde{V}_{j}^{\prime}\right)^{2}+\left(\tilde{V}_{j}\right)^{\frac{2 N}{N-2}}=1
$$

the property $\tilde{V}_{j}>0$ implies that $L_{1}, L_{2}<+\infty$. By (2.8) with $R=r_{j}^{n}$ and $r=R_{j-1}^{n}$ we get

$$
\begin{align*}
(-1)^{j-1}\left(\delta_{j}^{n}\right)^{\frac{N}{2}} v_{n}^{\prime}\left(R_{j-1}^{n}\right) & =\frac{\left(\delta_{j}^{n}\right)^{\frac{N}{2}}}{\left(R_{j-1}^{n}\right)^{N-1}} \int_{R_{j-1}^{n}}^{r_{j}^{n}} s^{N-1}\left(\left|v_{n}\right|^{\frac{N+2}{N-2}}+\epsilon_{n} s^{\alpha}\left|v_{n}\right|\right) d s \\
& =\int_{-\frac{r_{j}^{n}-R_{j-1}^{n}}{\delta_{j}^{n}}}^{0}\left(\frac{r_{j}^{n}+\delta_{j}^{n} s}{R_{j-1}^{n}}\right)^{N-1}\left[\left(\tilde{V}_{j}^{n}\right)^{\frac{N+2}{N-2}}+\epsilon_{n}\left(\delta_{j}^{n}\right)^{2}\left(r_{j}^{n}+\delta_{j}^{n} s\right)^{\alpha} \tilde{V}_{j}^{n}\right] d s \\
& \rightarrow \int_{-L_{1}}^{0}\left(\tilde{V}_{j}\right)^{\frac{N+2}{N-2}} d s \tag{2.43}
\end{align*}
$$

in view of $\tilde{V}_{j}^{n} \leq 1,(2.42)$ and

$$
\begin{equation*}
\frac{r_{j}^{n}}{\delta_{j}^{n}} \rightarrow+\infty, \frac{r_{j}^{n}-R_{j-1}^{n}}{\delta_{j}^{n}} \rightarrow L_{1} \in[0,+\infty) \Rightarrow \frac{r_{j}^{n}}{R_{j-1}^{n}}=1+\frac{\frac{r_{j}^{n}-R_{j-1}^{n}}{\delta_{j}^{n}}}{\frac{r_{j}^{n}}{\delta_{j}^{n}}-\frac{r_{j}^{n}-R_{j-1}^{n}}{\delta_{j}^{n}}} \rightarrow 1 \tag{2.44}
\end{equation*}
$$

as $n \rightarrow+\infty$. When $j-1 \in J,(2.43)$ is in contradiction with (2.34) since

$$
\frac{\left(\delta_{j-1}^{n}\right)^{\frac{N-2}{2}}}{\left(R_{j-1}^{n}\right)^{N-1}}=\left(\frac{\delta_{j-1}^{n}}{R_{j-1}^{n}}\right)^{\frac{N-2}{2}}\left(\frac{r_{j}^{n}}{R_{j-1}^{n}}\right)^{\frac{N}{2}}\left(\frac{\delta_{j}^{n}}{r_{j}^{n}}\right)^{\frac{N}{2}} \frac{1}{\left(\delta_{j}^{n}\right)^{\frac{N}{2}}}=o\left(\frac{1}{\left(\delta_{j}^{n}\right)^{\frac{N}{2}}}\right)
$$

as $n \rightarrow+\infty$, as it follows by (2.44), $j-1 \in J$ and $\frac{r_{j}^{n}}{\delta_{j}^{n}} \rightarrow+\infty$ as $n \rightarrow+\infty$. Then (2.40) is established.
To complete the proof of the Claim, we need to establish (2.41). Apply (2.8) with $R=r_{j}^{n}$ to get by (2.18) that

$$
\begin{equation*}
\left|v_{n}^{\prime}(r)\right| \leq\left(\frac{r_{j}^{n}}{r}\right)^{N-1}\left(\delta_{j}^{n}\right)^{-\frac{N-2}{2}}\left[\frac{r_{j}^{n}-R_{j-1}^{n}}{\left(\delta_{j}^{n}\right)^{2}}+\varepsilon_{n} \frac{\left(r_{j}^{n}\right)^{\alpha+1}}{N+\alpha}\right] \tag{2.45}
\end{equation*}
$$

for all $R_{j-1}^{n} \leq r \leq r_{j}^{n}$ and

$$
\begin{equation*}
\left|v_{n}^{\prime}(r)\right| \leq\left(\delta_{j}^{n}\right)^{-\frac{N-2}{2}}\left[\frac{r-r_{j}^{n}}{\left(\delta_{j}^{n}\right)^{2}}+\varepsilon_{n} \frac{r^{\alpha+1}}{N+\alpha}\right] \tag{2.46}
\end{equation*}
$$

for all $r_{j}^{n} \leq r \leq R_{j}^{n}$. We deduce the following estimates by integrating (2.45) in $\left[R_{j-1}^{n}, r_{j}^{n}\right]$ :

$$
\begin{equation*}
\left(\delta_{j}^{n}\right)^{-\frac{N-2}{2}}=\left|\int_{R_{j-1}^{n}}^{r_{j}^{n}} v_{n}^{\prime}\right| \leq\left(\frac{r_{j}^{n}}{R_{j-1}^{n}}\right)^{N-1}\left(\delta_{j}^{n}\right)^{-\frac{N-2}{2}}\left[\left(\frac{r_{j}^{n}-R_{j-1}^{n}}{\delta_{j}^{n}}\right)^{2}+\frac{\varepsilon_{n}}{N+\alpha}\right], \tag{2.47}
\end{equation*}
$$

and (2.46) in $\left[r_{j}^{n}, R_{j}^{n}\right]$ :

$$
\begin{equation*}
\left(\delta_{j}^{n}\right)^{-\frac{N-2}{2}}=\left|\int_{r_{j}^{n}}^{R_{j}^{n}} v_{n}^{\prime}\right| \leq\left(\delta_{j}^{n}\right)^{-\frac{N-2}{2}}\left[\left(\frac{R_{j}^{n}-r_{j}^{n}}{\delta_{j}^{n}}\right)^{2}+\frac{\varepsilon_{n}}{N+\alpha}\right], \tag{2.48}
\end{equation*}
$$

in view of $\alpha+2>0$ and $\int_{0}^{1} r^{\alpha+1} d r<+\infty$. Therefore we have shown that

$$
\begin{equation*}
\frac{R_{j}^{n}-r_{j}^{n}}{\delta_{j}^{n}}, \frac{r_{j}^{n}-R_{j-1}^{n}}{\delta_{j}^{n}} \geq \delta>0 \tag{2.49}
\end{equation*}
$$

for some $\delta>0$ in view of (2.44), and the validity of (2.41) follows.
When $k=1$, we can apply (2.35) with $j=1$ to get $\alpha \leq N-4$. Indeed, $\alpha>N-4$ would imply, by inserting (2.36) into (2.35), that $1=O\left(\varepsilon_{n}\left(R_{1}^{n}\right)^{\bar{N}-2}\right)$, yielding a contradiction in view of $\varepsilon_{n}\left(R_{1}^{n}\right)^{N-2} \rightarrow 0$ as $n \rightarrow+\infty$. If in addition $R_{1}^{n} \rightarrow R_{1}>0$ as $n \rightarrow+\infty$, by (2.38) for $j=2$ condition $R_{1}^{n}<1$ would imply $\delta_{2}^{n} \rightarrow 0$ and then $\frac{r_{2}^{n}}{\delta_{2}^{n}} \rightarrow+\infty$ as $n \rightarrow+\infty$, in contradiction with (2.40) for $j=2$. Hence $R_{1}^{n}=1$ for $n$ large and, when $\alpha<N-4$, by inserting (2.37) into (2.35) for $j=1$ we get that

$$
\delta_{1}^{n}=\left[\frac{(\alpha+2) \omega_{N-1} \int_{\mathbb{R}^{N}}|x|^{\alpha} V^{2}}{\left(\int_{\mathbb{R}^{N}} V^{N+2}{ }^{N-2}\right)^{2}} \varepsilon_{n}\right]^{\frac{1}{N-4-\alpha}}(1+o(1)),
$$

completing the proof for $k=1$.
When $k \geq 2$, by (2.38) and (2.40) for $j=2$ we can assume, up to a subsequence, that $\delta_{2}^{n} \rightarrow 0$ and $\frac{r_{2}^{n}}{\delta_{2}^{n}} \rightarrow L \in[0,+\infty)$ as $n \rightarrow+\infty$.
$3^{\text {rd }}$ Claim: There holds

$$
\begin{equation*}
\lim _{n \rightarrow+\infty} \frac{r_{2}^{n}}{\delta_{2}^{n}}=0 \tag{2.50}
\end{equation*}
$$

Assume by contradiction that $L>0$. Since

$$
\frac{r_{2}^{n}}{R_{1}^{n}}=1+\frac{\frac{r_{2}^{n}-R_{1}^{n}}{\delta_{2}^{n}}}{\frac{r_{2}^{n}}{\delta_{2}^{n}}-\frac{r_{2}^{n}-R_{1}^{n}}{\delta_{2}^{n}}} \rightarrow 1
$$

if $\frac{r_{2}^{n}-R_{1}^{n}}{\delta_{2}^{n}} \rightarrow 0$ as $n \rightarrow+\infty$, by (2.47)-(2.48) we can still deduce the validity of (2.49) for $j=2$. Up to a subsequence, we can then assume that

$$
\frac{R_{1}^{n}}{\delta_{2}^{n}} \rightarrow L_{1} \in[0, L), \quad \frac{R_{2}^{n}}{\delta_{2}^{n}} \rightarrow L_{2} \in(L,+\infty] .
$$

The function $V_{2}^{n}$ does solve

$$
\begin{cases}-\Delta V_{2}^{n}=\left(V_{2}^{n}\right)^{\frac{N+2}{N-2}}+\varepsilon_{n}\left(\delta_{2}^{n}\right)^{2+\alpha}|x|^{\alpha} V_{2}^{n} & \text { in } I_{n}=\left(\frac{R_{n}^{n}}{\delta_{2}^{n}}, \frac{R_{2}^{n}}{\delta_{2}^{n}}\right) \\ 0<V_{2}^{n} \leq V_{2}^{n}\left(\frac{r_{n}^{n}}{\delta_{2}^{n}}\right)=1 & \text { in } I_{n} \\ V_{2}^{n}=0 & \text { on } \partial I_{n}\end{cases}
$$

in view of (2.18). Arguing as above, by elliptic estimates we have that, up to a subsequence, $V_{2}^{n} \rightarrow V_{2}$ in $C_{\operatorname{loc}}^{1}(A), A=B_{L_{2}}(0) \backslash \overline{B_{L_{1}}(0)}$, where $V_{2}$ solves

$$
-\Delta V_{2}=\left(V_{2}\right)^{\frac{N+2}{N-2}} \text { in } A, \quad 0<V_{2} \leq V_{2}(L)=1 \text { in } A
$$

By (2.30) it follows that

$$
\begin{align*}
-\left(\delta_{2}^{n}\right)^{-\frac{N-2}{2}}\left(R_{1}^{n}\right)^{N-1} v_{n}^{\prime}\left(R_{1}^{n}\right) & =\int_{\frac{R_{1}^{n}}{\delta_{2}^{n}}}^{\frac{r_{2}^{n}}{\delta_{2}^{n}}} s^{N-1}\left(V_{2}^{n}\right)^{\frac{N+2}{N-2}}+\varepsilon_{n}\left(\delta_{2}^{n}\right)^{2+\alpha} \int_{\frac{R_{1}^{n}}{\delta_{2}^{n}}}^{\frac{r_{2}^{n}}{\delta_{2}^{n}}} s^{N-1+\alpha} V_{2}^{n} \\
& \rightarrow \int_{L_{1}}^{L} s^{N-1}\left(V_{2}\right)^{\frac{N+2}{N-2}} \tag{2.51}
\end{align*}
$$

as $n \rightarrow+\infty$ in view of $V_{2}^{n} \leq 1$. Since $1 \in J$, by (2.34) and (2.51) we get that $\delta_{1}^{n} \sim \delta_{2}^{n}$ as $n \rightarrow+\infty$, in contradiction with

$$
\frac{\delta_{2}^{n}}{\delta_{1}^{n}} \geq \frac{1}{2 L} \frac{r_{2}^{n}}{\delta_{1}^{n}} \geq \frac{1}{2 L} \frac{R_{1}^{n}}{\delta_{1}^{n}} \rightarrow+\infty
$$

as $n \rightarrow+\infty$ as it follows by (2.19). Then (2.50) is established and the Claim is proved.
Once (2.50) is established, we proceed as follows. Since $0 \leq \frac{r_{2}^{n}-R_{1}^{n}}{\delta_{2}^{n}} \leq \frac{r_{2}^{n}}{\delta_{2}^{n}} \rightarrow 0$ observe that

$$
\begin{equation*}
\frac{R_{1}^{n}}{r_{2}^{n}} \rightarrow 0 \text { as } n \rightarrow+\infty \tag{2.52}
\end{equation*}
$$

in view of (2.47). Up to a subsequence, we can assume that $\frac{R_{2}^{n}}{\delta_{2}^{n}} \rightarrow L_{2} \in(0,+\infty]$ in view of (2.48), and, arguing as above, deduce by elliptic estimates that $V_{2}^{n} \rightarrow V_{2}$ in $C_{\mathrm{loc}}^{1}\left(B_{L_{2}}(0) \backslash\{0\}\right)$ as $n \rightarrow+\infty$, where $V_{2}$ solves

$$
-\Delta V_{2}=\left(V_{2}\right)^{\frac{N+2}{N-2}} \text { in } B_{L_{2}}(0), \quad 0 \leq V_{2} \leq 1 \text { in } B_{L_{2}}(0)
$$

with $V_{2}\left(L_{2}\right)=0$ if $L_{2}<+\infty$. Since by (2.46) there holds

$$
\left|\left(V_{2}^{n}\right)^{\prime}\right|(r) \leq r-\frac{r_{2}^{n}}{\delta_{2}^{n}}+\varepsilon_{n}\left(\delta_{2}^{n}\right)^{\alpha+2} \frac{r^{\alpha+1}}{N+\alpha}
$$

for all $\frac{r_{2}^{n}}{\delta_{2}^{n}} \leq r \leq \frac{R_{2}^{n}}{\delta_{2}^{n}}$, we have that

$$
V_{2}^{n}(r)=1+\int_{\frac{r_{2}^{n}}{\delta_{2}^{n}}}^{r}\left(V_{2}^{n}\right)^{\prime} \geq 1-\frac{1}{2}\left(r-\frac{r_{2}^{n}}{\delta_{2}^{n}}\right)^{2}-\varepsilon_{n}\left(\delta_{2}^{n}\right)^{\alpha+2} \int_{0}^{r} \frac{s^{\alpha+1}}{N+\alpha}
$$

for all $\frac{r_{2}^{n}}{\delta_{2}^{n}} \leq r \leq \frac{R_{2}^{n}}{\delta_{2}^{n}}$, and then as $n \rightarrow+\infty$ we deduce that $1 \geq V_{2}(r) \geq 1-\frac{1}{2} r^{2}$ for all $0<r<L_{2}$. Hence $V_{2}(0)=1, L_{2}=+\infty$ by Pohozaev identity (2.20) and $V_{2}=V$, where $V$ is given by (2.13).

So far we have shown that $1 \in J \Rightarrow 2 \in J$. As already explained, the new estimate (2.16) becomes crucial here. The difficulty is that very few is known about $v_{n}$ in the range $\left[R_{1}^{n}, r_{2}^{n}\right]$, a problem which can be by-passed through the following trick. The key remark is that

$$
\begin{equation*}
\frac{1}{r^{N-1}} \int_{R_{1}^{n}}^{r} s^{N-1}\left(\left|v_{n}\right|^{\frac{N+2}{N-2}}+\varepsilon_{n} s^{\alpha}\left|v_{n}\right|\right) d s=\left(\delta_{2}^{n}\right)^{-\frac{N-2}{2}} O\left(\frac{r_{2}^{n}}{\left(\delta_{2}^{n}\right)^{2}}+\varepsilon_{n} r^{\alpha+1}\right) \tag{2.53}
\end{equation*}
$$

for all $r \in\left[R_{1}^{n}, r_{2}^{n}\right]$ in view of (2.18). By integrating (2.7) for $v_{n}$ in $\left(R_{1}^{n}, r\right)$ we get that

$$
\begin{equation*}
v_{n}^{\prime}(r)=\frac{\left(R_{1}^{n}\right)^{N-1} v_{n}^{\prime}\left(R_{1}^{n}\right)}{r^{N-1}}-\frac{1}{r^{N-1}} \int_{R_{1}^{n}}^{r} s^{N-1}\left(\left|v_{n}\right|^{\frac{N+2}{N-2}}+\epsilon s^{\alpha}\left|v_{n}\right|\right) d s \tag{2.54}
\end{equation*}
$$

for all $r \in\left[R_{1}^{n}, r_{2}^{n}\right]$. Inserting (2.34) with $j=1$ and (2.53) into (2.54) we deduce that

$$
v_{n}^{\prime}(r)=-\frac{\left(\delta_{1}^{n}\right)^{\frac{N-2}{2}}}{r^{N-1}} \int_{0}^{\infty} s^{N-1} V^{\frac{N+2}{N-2}}[1+o(1)]+\left(\delta_{2}^{n}\right)^{-\frac{N-2}{2}} O\left(\frac{r_{2}^{n}}{\left(\delta_{2}^{n}\right)^{2}}+\varepsilon_{n} r^{\alpha+1}\right)
$$

for all $r \in\left[R_{1}^{n}, r_{2}^{n}\right]$, and then

$$
\begin{align*}
\left(\delta_{2}^{n}\right)^{-\frac{N-2}{2}}= & -\int_{R_{1}^{n}}^{r_{2}^{n}} v_{n}^{\prime}  \tag{2.55}\\
= & \frac{\left(\delta_{1}^{n}\right)^{\frac{N-2}{2}}}{N-2} \int_{0}^{\infty} s^{N-1} V^{\frac{N+2}{N-2}}[1+o(1)]\left[\frac{1}{\left(R_{1}^{n}\right)^{N-2}}-\frac{1}{\left(r_{2}^{n}\right)^{N-2}}\right] \\
& +\left(\delta_{2}^{n}\right)^{-\frac{N-2}{2}} O\left(\left(\frac{r_{2}^{n}}{\delta_{2}^{n}}\right)^{2}+\varepsilon_{n} \int_{0}^{1} r^{\alpha+1}\right)
\end{align*}
$$

as $n \rightarrow+\infty$. Since $\frac{R_{1}^{n}}{r_{2}^{n}}, \frac{r_{2}^{n}}{\delta_{2}^{n}} \rightarrow 0$ as $n \rightarrow+\infty$ in view of (2.14) with $j=2$ and (2.52), by (2.55) we deduce the validity of $(2.16)$ for $R_{1}^{n}$.
We already have that $\alpha \leq N-4$. The case $\alpha=N-4$ can be excluded since (2.37) into (2.35) for $j=1$ would provide $1=O\left(\varepsilon_{n}\left(R_{1}^{n}\right)^{N-2}\left|\log \frac{R_{1}^{n}}{\delta_{1}^{n}}\right|\right)$, a contradiction in view of $\varepsilon_{n}, R_{1}^{n} \rightarrow 0$ and

$$
\frac{R_{1}^{n}}{\delta_{1}^{n}}=\frac{\delta_{2}^{n}}{R_{1}^{n}} \frac{\left(R_{1}^{n}\right)^{2}}{\delta_{1}^{n} \delta_{2}^{n}}=O\left(\frac{\delta_{2}^{n}}{R_{1}^{n}}\right)=O\left(\frac{1}{R_{1}^{n}}\right)
$$

as $n \rightarrow+\infty$, thanks to (2.16) for $R_{1}^{n}$. Hence $\alpha<N-4$ and (2.37) into (2.35) provides that

$$
\begin{equation*}
(\alpha+2) \varepsilon_{n}\left(\delta_{1}^{n}\right)^{2+\alpha} \int_{0}^{+\infty} r^{N-1+\alpha} V^{2}=\left(\int_{0}^{\infty} r^{N-1} V^{\frac{N+2}{N-2}}\right)^{2}\left(\frac{\delta_{1}^{n}}{R_{1}^{n}}\right)^{N-2}(1+o(1)) \tag{2.56}
\end{equation*}
$$

In view of $(2.16)$ for $R_{1}^{n},(2.56)$ gives that

$$
\left(\delta_{1}^{n}\right)^{\frac{N-6-2 \alpha}{2}} \sim \varepsilon_{n}\left(\delta_{2}^{n}\right)^{\frac{N-2}{2}} \rightarrow 0
$$

as $n \rightarrow+\infty$, which necessarily requires $\alpha<\frac{N-6}{2}$.
We can easily iterate the above procedure to show that $J=\{1, \ldots, k\}$ and (2.16) does hold for all $j=1, \ldots, k-1$. If (2.15) does hold, condition $R_{k}^{n}<1$ would imply the existence of $R_{k}^{n}<r_{k+1}^{n}<R_{k+1}^{n} \leq 1$ so that $v_{n}\left(R_{k+1}^{n}\right)=0$ and

$$
\left|v_{n}\right|\left(r_{k+1}^{n}\right)=\max _{\left[R_{k}^{n}, R_{k+1}^{n}\right]}\left|v_{n}\right| .
$$

Setting $\delta_{k+1}^{n}=\left|v_{n}\left(r_{k+1}^{n}\right)\right|^{-\frac{2}{N-2}}$, by (2.38) with $j=k$ we would deduce that $\delta_{k+1}^{n} \rightarrow 0$ and then $\frac{r_{k+1}^{n}}{\delta_{k+1}^{n}} \rightarrow+\infty$ as $n \rightarrow+\infty$, in contradiction with (2.40) for $j=k$. Hence $R_{k}^{n}=1$ for $n$ large.
Since by (2.14)

$$
\frac{\delta_{j}^{n}}{\delta_{j+1}^{n}}=\frac{\delta_{j}^{n}}{R_{j}^{n}} \frac{R_{j}^{n}}{\delta_{j+1}^{n}}<\frac{\delta_{j}^{n}}{R_{j}^{n}} \frac{r_{j+1}^{n}}{\delta_{j+1}^{n}} \rightarrow 0 \quad \text { as } n \rightarrow+\infty
$$

for all $j=1, \ldots, k-1$, by (2.35) and (2.37) we get that

$$
\begin{equation*}
(\alpha+2) \varepsilon_{n}\left(\delta_{j}^{n}\right)^{2+\alpha} \int_{0}^{+\infty} r^{N-1+\alpha} V^{2}=\left(\int_{0}^{\infty} r^{N-1} V^{\frac{N+2}{N-2}}\right)^{2}\left(\frac{\delta_{j}^{n}}{R_{j}^{n}}\right)^{N-2}(1+o(1)) \tag{2.57}
\end{equation*}
$$

For $j=k$ by (2.57) we have that

$$
\begin{equation*}
\delta_{k}^{n}=\left[\frac{(\alpha+2) \omega_{N-1} \int_{\mathbb{R}^{N}}|x|^{\alpha} V^{2}}{\left(\int_{\mathbb{R}^{N}} V^{\frac{N+2}{N-2}}\right)^{2}} \varepsilon_{n}\right]^{\frac{1}{N-4-\alpha}}(1+o(1)) \tag{2.58}
\end{equation*}
$$

as $n \rightarrow+\infty$ in view of $R_{k}^{n}=1$. For $j=1, \ldots, k-1$, by inserting (2.16) into (2.57) we have that

$$
(\alpha+2) \int_{\mathbb{R}^{N}}|x|^{\alpha} V^{2} \varepsilon_{n}\left(\delta_{j+1}^{n}\right)^{\frac{N-2}{2}}=(N-2) \int_{\mathbb{R}^{N}} V^{\frac{N+2}{N-2}}\left(\delta_{j}^{n}\right)^{\frac{N-6-2 \alpha}{2}}(1+o(1))
$$

as $n \rightarrow+\infty$. We finally deduce that

$$
\begin{equation*}
\delta_{j}^{n}=\left[\frac{(\alpha+2) \int_{\mathbb{R}^{N}}|x|^{\alpha} V^{2}}{(N-2) \int_{\mathbb{R}^{N}} V^{\frac{N+2}{N-2}}}\right]^{\frac{2}{N-6-2 \alpha}}\left(\varepsilon_{n}\right)^{\frac{2}{N-6-2 \alpha}}\left(\delta_{j+1}^{n}\right)^{\frac{N-2}{N-6-2 \alpha}}(1+o(1)) \tag{2.59}
\end{equation*}
$$

as $n \rightarrow+\infty$ for all $j=1, \ldots, k-1$, or equivalently

$$
\delta_{j}^{n} \sim\left[\frac{(\alpha+2) \int_{\mathbb{R}^{N}}|x|^{\alpha} V^{2}}{(N-2) \int_{\mathbb{R}^{N}} V^{\frac{N+2}{N-2}}} \varepsilon_{n}\right]^{\frac{(N-2)\left(\frac{N-2}{N-6-2 \alpha}\right)^{k-j}-(N-4-\alpha)}{(2+\alpha)(N-4-\alpha)}}\left[\frac{(N-2) \omega_{N-1}}{\int_{\mathbb{R}^{N}} V^{\frac{N+2}{N-2}}}\right]^{\frac{1}{N-4-\alpha}\left(\frac{N-2}{N-6-2 \alpha}\right)^{k-j}}
$$

as it follows iteratively by (2.58)-(2.59). This completes the proof.

## 3. A perturbative approach: Setting of the problem

In this section we provide a very delicate perturbative scheme in order to prove Theorem 1.2. The main ingredient in our construction are the Euclidean bubbles defined in (1.3) which are all the solutions to the critical equation (1.6) with Hardy potential in the Euclidean space.
It turns out to be useful to rewrite problem (1.7) as follows. We let $1^{*}: L^{\frac{2 N}{N+2}}(\Omega) \rightarrow H_{0}^{1}(\Omega)$ be the adjoint operator of the embedding $1: H_{0}^{1}(\Omega) \hookrightarrow L^{\frac{2 N}{N-2}}(\Omega)$, i.e. for any $w \in L^{\frac{2 N}{N+2}}(\Omega)$ the function $u=1^{*}(w) \in H_{0}^{1}(\Omega)$ is the unique solution of

$$
\begin{equation*}
L_{\gamma} u=-\Delta u-\gamma \frac{u}{|x|^{2}}=w \text { in } \Omega, u=0 \text { on } \partial \Omega \tag{3.1}
\end{equation*}
$$

By continuity of the embedding $H_{0}^{1}(\Omega) \hookrightarrow L^{\frac{2 N}{N-2}}(\Omega)$, we get

$$
\left\|1^{*}(w)\right\| \leq C|w|_{\frac{2 N}{N+2}}
$$

for some $C>0$. We rewrite problem (1.7) as

$$
\begin{equation*}
u=1^{*}\left[|u|^{\frac{4}{N-2}} u+\varepsilon u\right], u \in H_{0}^{1}(\Omega) . \tag{3.2}
\end{equation*}
$$

3.1. The projection of the bubble. To get a good approximation of our solution, it is necessary to project the bubble $U_{\mu}$ onto the space $H_{0}^{1}(\Omega)$. More precisely, letting $P U_{\mu}=1^{*}\left(U_{\mu}^{\frac{N+2}{N-2}}\right)$, according to (3.1) $P U_{\mu}$ solves

$$
\begin{equation*}
L_{\gamma} P U_{\mu}=L_{\gamma} U_{\mu}=U_{\mu}^{\frac{N+2}{N-2}} \text { in } \Omega, P U_{\mu}=0 \text { on } \partial \Omega \tag{3.3}
\end{equation*}
$$

in view of (1.6) for $U_{\mu}$. Since $U_{\mu}^{\frac{N+2}{N-2}} \geq 0$ in $\Omega$ and $P U_{\mu} \in H_{0}^{1}(\Omega)$, by the weak maximum principle we have that $P U_{\mu} \geq 0$ in $\Omega$. To get the expansion of $P U_{\mu}$ with respect to $\mu$, we make use of some tools introduced by Ghossoub and Robert [18, 20]. First, let us recall the existence of a positive singular solution $G_{\gamma} \in C^{2}(\bar{\Omega} \backslash\{0\})$ to

$$
\begin{cases}L_{\gamma} G_{\gamma}=0 & \text { in } \Omega \backslash\{0\}  \tag{3.4}\\ G_{\gamma}=0 & \text { on } \partial \Omega\end{cases}
$$

having near the origin the following expansion:

$$
\begin{equation*}
G_{\gamma}(x)=\frac{c_{1}}{|x|^{\beta_{+}}}-\frac{c_{2}}{|x|^{\beta_{-}}}+o\left(\frac{1}{|x|^{\beta_{-}}}\right) \quad \text { as } x \rightarrow 0 \tag{3.5}
\end{equation*}
$$

where $c_{1}, c_{2}>0$ and $\beta_{ \pm}$are given in (1.5). The function $H_{\gamma}=\frac{c_{1}}{|x|^{\beta}+}-G_{\gamma}$ in turn satisfies

$$
\begin{cases}L_{\gamma} H_{\gamma}=0 & \text { in } \Omega \backslash\{0\}  \tag{3.6}\\ H_{\gamma}=\frac{c_{1}}{|x|^{\beta_{+}}} & \text {on } \partial \Omega\end{cases}
$$

with

$$
\begin{equation*}
H_{\gamma}(x) \sim \frac{c_{2}}{|x|^{\beta_{-}}} \quad \text { as } x \rightarrow 0 \tag{3.7}
\end{equation*}
$$

By Theorem 9 in [20] observe that $H_{\gamma} \in H_{0}^{1}(\Omega)$, whereas $G_{\gamma} \notin H_{0}^{1}(\Omega)$. The quantity $m=m_{\gamma, 0}=$ $\frac{c_{2}}{c_{1}}>0$ is referred to as the Hardy interior mass of $\Omega$ associated to $L_{\gamma}$ and w.l.o.g. we can assume $c_{1}=1$.
We have the following estimates.
Lemma 3.1. There hold
(i) $0 \leq P U_{\mu} \leq U_{\mu}$ in $\Omega$
(ii) $P U_{\mu}=U_{\mu}-\alpha_{N} \mu^{\Gamma} H_{\gamma}+O\left(\frac{\mu^{\frac{N+2}{N-2} \Gamma}}{|x|^{\beta-}}\right)$ uniformly in $\Omega$ as $\mu \rightarrow 0$
(iii) $P U_{\mu}=U_{\mu}+O\left(\frac{\mu^{\Gamma}}{|x|^{\beta}-}\right)$ uniformly in $\Omega$ as $\mu \rightarrow 0$.

Proof. (i) The function $\varphi_{\mu}=U_{\mu}-P U_{\mu}$ solves

$$
\begin{cases}L_{\gamma} \varphi_{\mu}=0 & \text { in } \Omega \backslash\{0\} \\ \varphi_{\mu}=U_{\mu} & \text { on } \partial \Omega\end{cases}
$$

Since $U_{\mu} \geq 0$ and $\varphi_{\mu} \in H^{1}(\Omega)$, by the weak maximum principle it follows that $\varphi_{\mu} \geq 0$ and (i) holds.
(ii) Let $W_{\mu}=U_{\mu}-P U_{\mu}-\alpha_{N} \mu^{\Gamma} H_{\gamma}$. Then $W_{\mu}$ satisfies the following problem

$$
\begin{cases}L_{\gamma} W_{\mu}=0 & \text { in } \Omega \backslash\{0\} \\ W_{\mu}=\frac{\alpha_{N} \mu^{\Gamma}}{|x|^{\beta}-\left(\mu^{\frac{4 \Gamma}{N-2}}+|x|^{\frac{4 \Gamma}{N-2}}\right)^{\frac{N-2}{2}}}-\frac{\alpha_{N} \mu^{\Gamma}}{|x|^{\beta+}}=O\left(\mu^{\frac{N+2}{N-2} \Gamma}\right) & \text { on } \partial \Omega .\end{cases}
$$

Since $W_{\mu} \in H^{1}(\Omega)$, by weak comparison principle it follows that

$$
W_{\mu}=O\left(\mu^{\frac{N+2}{N-2} \Gamma} H_{\gamma}\right)=O\left(\frac{\mu^{\frac{N+2}{N-2} \Gamma}}{|x|^{\beta_{-}}}\right) \quad \text { in } \Omega \backslash\{0\}
$$

in view of (3.7), and (ii) follows.
(iii) It follows immediately by (ii) and (3.7).
3.2. The linearized operator. It is important to linearize the problem (1.6) around the solution $U$ defined in (1.4). More precisely, let us consider the linear problem

$$
\left\{\begin{array}{l}
-\Delta Z-\gamma \frac{Z}{|x|^{2}}=\frac{N+2}{N-2} U^{\frac{4}{N-2}} Z \text { in } \mathbb{R}^{N}  \tag{3.8}\\
Z \in D^{1,2}\left(\mathbb{R}^{N}\right)
\end{array}\right.
$$

Dancer, Gladiali and Grossi in [13] classified all the solutions to (3.8):
Lemma 3.2 (Lemma 1.3, [13]). Let $\gamma<\frac{(N-2)^{2}}{4}$ so that $\gamma \neq \gamma_{j}$ for all $j \in \mathbb{N}$, where $\gamma_{j}$ is given by (1.8). Then the space of solutions to (3.8) has dimension 1 and is spanned by

$$
Z^{\gamma}(x)=\frac{1-|x|^{\frac{4 \Gamma}{N-2}}}{|x|^{\beta_{-}}\left(1+|x|^{\frac{4 \Gamma}{N-2}}\right)^{\frac{N}{2}}}, x \in \mathbb{R}^{N} .
$$

If $\gamma=\gamma_{j}$ for some $j \in \mathbb{N}$, then the space of solutions to (3.8) has dimension $1+\frac{(N+2 j-2)(N+j-3)!}{(N-2)!j!}$ and is spanned by

$$
Z^{\gamma}(x) \quad \text { and } \quad Z_{i}^{\gamma}(x)=\frac{|x|^{\frac{N \Gamma}{N-2}-\frac{N-2}{2}} P_{j, i}(x)}{\left(1+|x|^{\frac{4 \Gamma}{N-2}}\right)^{\frac{N}{2}}}, i=1, \ldots, \frac{(N+2 j-2)(N+j-3)!}{(N-2)!j!}
$$

where $\left\{P_{j, i}\right\}$ is a basis for the space $\mathbb{P}_{j}\left(\mathbb{R}^{N}\right)$ of $j$-homogeneous harmonic polynomials in $\mathbb{R}^{N}$.
Given $\mathcal{G}$ a closed subgroup in the space of linear isometries $\mathcal{O}(N)$ of $\mathbb{R}^{N}$, we say that a domain $\Omega \subset \mathbb{R}^{N}$ is $\mathcal{G}$-invariant if $\mathcal{G} x \subset \Omega$ for any $x \in \Omega$ and a function $u: \Omega \rightarrow \mathbb{R}$ is $\mathcal{G}$-invariant if $u(g x)=u(x)$ for any $x \in \Omega$ and $g \in \mathcal{G}$.

Definition 3.3. If $\gamma=\gamma_{j}$ for some $j \in \mathbb{N}$ (see (1.8)), $\Omega$ is said to be a $j$-admissible domain if $\Omega$ is $\mathcal{G}_{j}$-invariant for some closed subgroup $\mathcal{G}_{j} \subset \mathcal{O}(N)$ so that $\int_{\mathbb{R}^{N}} Z_{i}^{\gamma}(x) \phi(x) d x=0$ for any $i$ and any $\mathcal{G}_{j}$-invariant function $\phi \in D^{1,2}\left(\mathbb{R}^{N}\right)$.

Remark 3.4. A ball is $j$-admissible for all $j \in \mathbb{N}$ by taking $\mathcal{G}_{j}=O(N)$. Any even domain $\Omega$ (i.e. $x \in \Omega$ iff $-x \in \Omega$ ) is $j$-admissible for all $j \in \mathbb{N}$ odd by taking $\mathcal{G}_{j}=\{I d,-I d\}$, since any homogeneous harmonic polynomials of odd degree is odd.

Remark 3.5. In the following we will work in a setting where the space of solutions to (3.8) is simply generated by $Z^{\gamma}$. In a general domain, we will require either $\gamma>0$ or $\gamma \leq 0$ with $\gamma \neq \gamma_{j}$ for all $j \in \mathbb{N}$. If $\gamma=\gamma_{j}$ for some $j \in \mathbb{N}$, we will assume that $\Omega$ is a $j$-admissible domain and we will work in the space of $\mathcal{G}_{j}$-invariant functions. Indeed, by Lemma 3.2 we immediately deduce that the space of $\mathcal{G}_{j}$-invariant solutions to (3.8) is spanned by $Z^{\gamma}$.

From now on we let $Z=Z^{\gamma}$ and we omit the dependence on $\gamma$. It is clear that the function

$$
Z_{\mu}(x)=\mu^{-\frac{N-2}{2}} Z\left(\frac{x}{\mu}\right)=\frac{\mu^{\Gamma}\left(\mu^{\frac{4 \Gamma}{N-2}}-|x|^{\frac{4 \Gamma}{N-2}}\right)}{|x|^{\beta_{-}}\left(\mu^{\frac{4 \Gamma}{N-2}}+|x|^{\frac{4 \Gamma}{N-2}}\right)^{\frac{N}{2}}}, \quad x \in \mathbb{R}^{N},
$$

solves the linear problem

$$
-\Delta Z_{\mu}-\gamma \frac{Z_{\mu}}{|x|^{2}}=\frac{N+2}{N-2} U_{\mu}^{\frac{4}{N-2}} Z_{\mu} \text { in } \mathbb{R}^{N}
$$

We need to project the function $Z_{\mu}$ to fit Dirichlet boundary condition, i.e. we consider the function $P Z_{\mu}=1^{*}\left(\frac{N+2}{N-2} U_{\mu}^{\frac{4}{N-2}} Z_{\mu}\right)$ according to (3.1). We need an expansion of $P Z_{\mu}$ with respect to $\mu$.
Lemma 3.6. As $\mu \rightarrow 0$ there hold uniformly in $\Omega$
(i) $P Z_{\mu}=Z_{\mu}+\mu^{\Gamma} H_{\gamma}+O\left(\frac{\mu^{\frac{N+2}{N-2} \Gamma}}{|x|^{\beta-}}\right)$
(ii) $P Z_{\mu}=Z_{\mu}+O\left(\frac{\mu^{\Gamma}}{|x|^{\beta}-}\right)$.

Proof. We argue as in the proof of Lemma 3.1.
3.3. The tower. Let $k \geq 1$ be a fixed integer. We look for solutions to (1.7), or equivalently to (3.2), of the form

$$
\begin{equation*}
u=\sum_{j=1}^{k}(-1)^{j} P U_{\mu_{j}}+\Phi \tag{3.9}
\end{equation*}
$$

where

$$
\begin{equation*}
\mu_{1}=e^{-\frac{d_{1}}{\varepsilon}} \tag{3.10}
\end{equation*}
$$

when $\Gamma=1$ and

$$
\begin{equation*}
\mu_{j}=d_{j} \varepsilon^{\sigma_{j}}, j=1, \ldots, k \tag{3.11}
\end{equation*}
$$

when $\Gamma>1$, with $d_{1}, \ldots, d_{k} \in(0,+\infty)$ and $\sigma_{j}$ given by (2.17). The choice (3.10)-(3.11) of the concentration rates is motivated by the validity of the following crucial relations: for $\Gamma=1$

$$
\begin{equation*}
\mu_{1}^{2} \sim \varepsilon \mu_{1}^{2} \log \frac{1}{\mu_{1}} \tag{3.12}
\end{equation*}
$$

and for $\Gamma>1$

$$
\begin{equation*}
\mu_{1}^{2 \Gamma} \sim \varepsilon \mu_{1}^{2} \quad \text { and } \quad\left(\frac{\mu_{j}}{\mu_{j-1}}\right)^{\Gamma} \sim \varepsilon \mu_{j}^{2}, j=2, \ldots, k \tag{3.13}
\end{equation*}
$$

To build solutions of given sign with a simple blow-up point at the origin, we need to assume $\Gamma \geq 1$ and consider the case $k=1$. The assumption $\Gamma>2$ is necessary when constructing sign-changing solutions, i.e. $k \geq 2$, to guarantee $\sigma_{1}, \ldots, \sigma_{k}>0$.

The remainder term $\Phi$ shall be splitted into the sum of $k$ terms of different order:

$$
\begin{equation*}
\Phi=\sum_{\ell=1}^{k} \phi_{\ell} \tag{3.14}
\end{equation*}
$$

where each remainder term $\phi_{\ell}$ only depends on $\mu_{1}, \ldots, \mu_{\ell}$ and belongs to the space $\mathcal{K}_{\ell}^{\perp}$ defined as follows. For any $\ell=1, \ldots, k$ we define the subspace $\mathcal{K}_{\ell}=\operatorname{Span}\left\{P Z_{\mu_{1}}, \ldots, P Z_{\mu_{\ell}}\right\}$ and either

$$
\mathcal{K}_{\ell}^{\perp}=\left\{\phi \in H_{0}^{1}(\Omega):\left\langle\phi, P Z_{\mu_{i}}\right\rangle=0, i=1, \ldots, \ell\right\}
$$

when $\Omega$ is a general domain and $\gamma \neq \gamma_{j}$ for all $j \in \mathbb{N}$ or

$$
\mathcal{K}_{\ell}^{\perp}=\left\{\phi \in H_{0}^{1}(\Omega): \phi \text { is } \mathcal{G}_{j} \text {-invariant, }\left\langle\phi, P Z_{\mu_{i}}\right\rangle=0, i=1, \ldots, \ell\right\}
$$

when $\Omega$ is $j$-admissible and $\gamma=\gamma_{j}$ for some $j \in \mathbb{N}$ (see Remark 3.5). We also define $\Pi_{\ell}$ and $\Pi_{\ell}^{\perp}$ as the projections of the Sobolev space $H_{0}^{1}(\Omega)$ onto the respective subspaces $\mathcal{K}_{\ell}$ and $\mathcal{K}_{\ell}{ }_{\ell}$.
In order to solve (3.2), we shall solve the system

$$
\begin{align*}
& \Pi_{k}^{\perp}\left\{u-1^{*}\left[|u|^{\frac{4}{N-2}} u+\varepsilon u\right]\right\}=0  \tag{3.15}\\
& \Pi_{k}\left\{u-1^{*}\left[|u|^{\frac{4}{N-2}} u+\varepsilon u\right]\right\}=0
\end{align*}
$$

for $u$ given as in (3.9). For sake of simplicity, for any $j=1, \ldots, k$ we set $U_{j}=U_{\mu_{j}}$ and $Z_{j}=Z_{\mu_{j}}$.

## 4. The Ljapunov-Schmidt procedure

In this section we give an outline for the proof of Theorem 1.2. To make the presentation more clear, all the results are stated without proofs, which are postponed into the Appendix.
4.1. The remainder term: solving equation (3.15). In order to find the remainder term $\Phi$, we shall find functions $\phi_{\ell}, \ell=1, \ldots, k$, which solve the following system:

$$
\left\{\begin{array}{l}
\mathcal{E}_{1}+\mathcal{L}_{1}\left(\phi_{1}\right)+\mathcal{N}_{1}\left(\phi_{1}\right)=0  \tag{4.1}\\
\mathcal{E}_{2}+\mathcal{L}_{2}\left(\phi_{2}\right)+\mathcal{N}_{2}\left(\phi_{1}, \phi_{2}\right)=0 \\
\ldots \\
\ldots \\
\mathcal{E}_{k}+\mathcal{L}_{k}\left(\phi_{k}\right)+\mathcal{N}_{k}\left(\phi_{1}, \ldots, \phi_{k}\right)=0
\end{array}\right.
$$

Setting $f(u)=|u|^{\frac{4}{N-2}} u$, the error terms $\mathcal{E}_{\ell}$ are defined by

$$
\mathcal{E}_{\ell}=\Pi_{\ell}^{\perp}\left\{(-1)^{\ell} P U_{\ell}-1^{*}\left[f\left(\sum_{j=1}^{\ell}(-1)^{j} P U_{j}\right)-f\left(\sum_{j=1}^{\ell-1}(-1)^{j} P U_{j}\right)+\varepsilon(-1)^{\ell} P U_{\ell}\right]\right\}
$$

and the linear operators $\mathcal{L}_{\ell}$ are given by

$$
\mathcal{L}_{\ell}(\phi)=\Pi_{\ell}^{\perp}\left\{\phi-1^{*}\left[f^{\prime}\left(\sum_{j=1}^{\ell}(-1)^{j} P U_{j}\right) \phi+\varepsilon \phi\right]\right\}
$$

with the convention that a sum over an empty set of indices is zero. The nonlinear terms $\mathcal{N}_{\ell}$ have the form

$$
\begin{align*}
& \mathcal{N}_{\ell}\left(\phi_{1}, \ldots, \phi_{\ell}\right)= \\
& \Pi_{\ell}^{\perp}\left\{-1^{*}\left[f\left(\sum_{j=1}^{\ell}\left((-1)^{j} P U_{j}+\phi_{j}\right)\right)-f\left(\sum_{j=1}^{\ell}(-1)^{j} P U_{j}\right)-f^{\prime}\left(\sum_{j=1}^{\ell}(-1)^{j} P U_{j}\right) \phi_{\ell}\right.\right.  \tag{4.2}\\
& \left.\left.-f\left(\sum_{j=1}^{\ell-1}\left((-1)^{j} P U_{j}+\phi_{j}\right)\right)+f\left(\sum_{j=1}^{\ell-1}(-1)^{j} P U_{j}\right)\right]\right\}
\end{align*}
$$

In order to solve system (4.1), first we need to evaluate the $H_{0}^{1}(\Omega)-$ norm of the error terms $\mathcal{E}_{\ell}$.
Lemma 4.1. For any $\ell=1, \ldots, k$ and any compact subset $A_{\ell} \subset(0,+\infty)^{\ell}$ there exist $C, \varepsilon_{0}>0$ such that for any $\varepsilon \in\left(0, \varepsilon_{0}\right)$ and for any $\left(d_{1}, \ldots, d_{\ell}\right) \in A_{\ell}$ there holds

$$
\left\|\mathcal{E}_{1}\right\|=\left\{\begin{array}{ll}
O\left(\varepsilon \mu_{1}^{\Gamma}\right) & \text { if } 1 \leq \Gamma<2  \tag{4.3}\\
O\left(\varepsilon \mu_{1}^{2} \log ^{\frac{N+2}{2 N}} \frac{1}{\mu_{1}}\right) & \text { if } \Gamma=2 \\
O\left(\varepsilon \mu_{1}^{2}\right) & \text { if } \Gamma>2
\end{array}+ \begin{cases}O\left(\mu_{1}^{2 \Gamma}\right) & \text { if } 3 \leq N \leq 5 \\
O\left(\mu_{1}^{2 \Gamma} \log ^{\frac{2}{3}} \frac{1}{\mu_{1}}\right) & \text { if } N=6 \\
O\left(\mu_{1}^{\frac{N+2}{N-2} \Gamma}\right) & \text { if } N \geq 7\end{cases}\right.
$$

and

$$
\left\|\mathcal{E}_{\ell}\right\|=O\left(\varepsilon \mu_{\ell}^{2}\right)+ \begin{cases}O\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}\right) & \text { if } 3 \leq N \leq 5  \tag{4.4}\\ O\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\frac{N+2}{N-2} \frac{\Gamma}{2}} \log ^{\frac{2}{3}} \frac{1}{\mu_{\ell}}\right) & \text { if } N \geq 6\end{cases}
$$

for any $l=2, \ldots, k$, when $k \geq 2$ and $\Gamma>2$.
Next, we need to understand the invertibility of the linear operators $\mathcal{L}_{\ell}$. This is done in the following lemma whose proof can be carried out as in [27].

Lemma 4.2. For any $\ell=1, \ldots, k$ and any compact subset $A_{\ell} \subset(0,+\infty)^{\ell}$ there exist $C, \varepsilon_{0}>0$ such that for any $\varepsilon \in\left(0, \varepsilon_{0}\right)$ and for any $\left(d_{1}, \ldots, d_{\ell}\right) \in A_{\ell}$ there holds

$$
\begin{equation*}
\left\|\mathcal{L}_{\ell}\left(\phi_{\ell}\right)\right\| \geq C\left\|\phi_{\ell}\right\| \text { for any } \phi_{\ell} \in \mathcal{K}_{\ell}^{\perp} \tag{4.5}
\end{equation*}
$$

In particular $\mathcal{L}_{\ell}^{-1}: \mathcal{K}_{\ell}^{\perp} \rightarrow K_{\ell}^{\perp}$ is well defined for $\varepsilon \in\left(0, \varepsilon_{0}\right)$ and $\left(d_{1}, \ldots, d_{\ell}\right) \in A_{\ell}$ and has uniformly bounded operatorial norm.

Finally, we are able to solve system (4.1). This is done in the following proposition, whose proof in the Appendix relies on a sophisticated contraction mapping argument.

Proposition 4.3. Given $A \subset(0,+\infty)^{k}$ compact, there exists $\varepsilon_{0}>0$ such that for any $\varepsilon \in\left(0, \varepsilon_{0}\right)$ there exist $C^{1}$-maps $\left(d_{1}, \ldots, d_{k}\right) \in A \rightarrow \phi_{\ell, \varepsilon}=\phi_{\ell, \varepsilon}\left(d_{1}, \ldots, d_{\ell}\right) \in \mathcal{K}_{\ell}^{\perp}, \ell=1, \ldots, k$, which solve (4.1) and satisfy uniform estimates:

$$
\begin{equation*}
\left\|\phi_{1, \varepsilon}\right\|=O\left(\left\|\mathcal{E}_{1}\right\|\right), \quad\left\|\phi_{\ell, \varepsilon}\right\|=O\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}+\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\frac{\Gamma}{2}+1}+\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\frac{N+2}{2(N-2)} \Gamma} \log ^{\frac{2}{3}} \frac{1}{\mu_{\ell}}\right) \tag{4.6}
\end{equation*}
$$

for $l \geq 2$ and

$$
\begin{equation*}
\left\|\nabla_{\left(d_{1}, \ldots, d_{\ell}\right)} \phi_{\ell, \varepsilon}\right\|=o(1) \quad \ell=1, \ldots, k \tag{4.7}
\end{equation*}
$$

Moreover, there exists $\rho>0$ so that

$$
\begin{equation*}
\left|\phi_{\ell, \varepsilon}(x)\right|=O\left(\frac{1}{\mu_{\ell}^{\Gamma}|x|^{\beta_{-}}}\right) \quad \text { if } x \in B_{\rho \mu_{\ell}}(0) \tag{4.8}
\end{equation*}
$$

4.2. The reduced problem: proof of Theorem 1.2. Let us recall the expression for the energy functional $J_{\varepsilon}: H_{0}^{1}(\Omega) \rightarrow \mathbb{R}$ :

$$
J_{\epsilon}(u)=\frac{1}{2} \int_{\Omega}\left(|\nabla u|^{2}-\gamma \frac{u^{2}}{|x|^{2}}-\epsilon u^{2}\right) d x-\frac{N-2}{2 N} \int_{\Omega}|u|^{\frac{2 N}{N-2}} d x
$$

whose critical points are solutions to the problem (1.7). Let us introduce the reduced energy as

$$
J_{\varepsilon}\left(\mu_{1}, \ldots, \mu_{k}\right)=J_{\varepsilon}\left(\sum_{j=1}^{k}(-1)^{j} P U_{j}\right)
$$

Given $\Phi_{\varepsilon}$ according to (3.14) and Proposition 4.3, the following result is the main core of the finite dimensional reduction of our problem.
Proposition 4.4. Given (3.10)-(3.11), we have that

$$
J_{\varepsilon}\left(\mu_{1}\right)=A_{1}+\left\{\begin{array}{ll}
A_{2} m \mu_{1}^{2}-A_{3} \varepsilon \mu_{1}^{2} \log \frac{1}{\mu_{1}} & \text { if } \Gamma=1  \tag{4.9}\\
A_{2} m \mu_{1}^{2 \Gamma}-A_{3} \varepsilon \mu_{1}^{2} & \text { if } \Gamma>1
\end{array}+\Upsilon_{1}\left(\mu_{1}\right)\right.
$$

and when $\Gamma>2$

$$
\begin{align*}
J_{\varepsilon}\left(\mu_{1}, \ldots, \mu_{k}\right)= & k A_{1}+A_{2} m \mu_{1}^{2 \Gamma}-A_{3} \varepsilon \mu_{1}^{2}+\sum_{\ell=2}^{k}\left[A_{4}\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}-A_{3} \varepsilon \mu_{\ell}^{2}\right]  \tag{4.10}\\
& +\sum_{\ell=1}^{k} \Upsilon_{\ell}\left(\mu_{1}, \ldots, \mu_{\ell}\right)
\end{align*}
$$

where $\left|\Upsilon_{1}\right|=o\left(\mu_{1}^{2 \Gamma}\right)$ and $\left|\Upsilon_{\ell}\right|=o\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}\right), \ell=2, \ldots, k$, do hold as $\varepsilon \rightarrow 0$ locally uniformly for $\left(d_{1}, \ldots, d_{k}\right)$ in $(0,+\infty)^{k}$. Here $A_{1}, \ldots, A_{4}>0$ and $m>0$ is the Hardy interior mass of $\Omega$ associated to $L_{\gamma}$. Moreover, critical points of

$$
\widetilde{J}_{\varepsilon}\left(\mu_{1}, \ldots, \mu_{k}\right)=J_{\varepsilon}\left(\sum_{j=1}^{k}(-1)^{j} P U_{j}+\Phi_{\varepsilon}\right)=J_{\varepsilon}\left(\mu_{1}, \ldots, \mu_{k}\right)+\sum_{\ell=1}^{k} \widetilde{\Upsilon}_{\ell}\left(\mu_{1}, \ldots, \mu_{\ell}\right)
$$

give rise to solutions $\sum_{j=1}^{k}(-1)^{j} P U_{j}+\Phi_{\varepsilon}$ of (1.7), where $\widetilde{\Upsilon}_{\ell}$ satisfies the same estimate as $\Upsilon_{\ell}$.
Proof of Theorem 1.2. By (3.10)-(3.11) and Proposition 4.4 it is sufficient to find a critical point of

$$
F_{\varepsilon}\left(d_{1}\right)=e^{-\frac{2 d_{1}}{\varepsilon}}\left(A_{2} m-A_{3} d_{1}+o_{\ell}(1)\right)
$$

when $\Gamma=1$ and

$$
F_{\varepsilon}\left(d_{1}, \ldots, d_{k}\right)=\sum_{\ell=1}^{k} \varepsilon^{2 \sigma_{\ell}+1}\left(G_{\ell}\left(d_{1}, \ldots, d_{\ell}\right)+o_{\ell}(1)\right)
$$

when $\Gamma>1$, where

$$
G_{1}\left(d_{1}\right)=A_{2} m d_{1}^{2 \Gamma}-A_{3} d_{1}^{2}, \quad G_{\ell}\left(d_{1}, \ldots, d_{\ell}\right)=A_{4}\left(\frac{d_{\ell}}{d_{\ell-1}}\right)^{\Gamma}-A_{3} d_{\ell}^{2}, \ell=2, \ldots, k
$$

Here $o_{\ell}(1)$ only depends on $d_{1}, \ldots, d_{\ell}$ and $o_{\ell}(1) \rightarrow 0$ as $\varepsilon \rightarrow 0$ locally uniformly for $\left(d_{1}, \ldots, d_{\ell}\right)$ in $(0,+\infty)^{\ell}$. For $k=1$ it is easily found an interval

$$
I=\left\{\begin{array}{ll}
\left(\frac{A_{2}}{A_{3}} m+\frac{\varepsilon}{4}, \frac{A_{2}}{A_{3}} m+\varepsilon\right) & \text { if } \Gamma=1 \\
\left(\frac{1}{2}\left(\frac{A_{3}}{A_{2} m \Gamma}\right)^{\frac{1}{2(\Gamma-1)}}, 2\left(\frac{A_{3}}{A_{2} m \Gamma}\right)^{\frac{1}{2(\Gamma-1)}}\right) & \text { if } \Gamma>1
\end{array} \subset(0,+\infty)\right.
$$

so that

$$
\inf _{I} F_{\varepsilon}<\inf _{\partial I} F_{\varepsilon}
$$

for $\varepsilon$ small, which guarantees the existence of a minimum point $d_{\varepsilon} \in I$ of $F_{\varepsilon}$. For $k \geq 2$ it is still possible to show that $F_{\varepsilon}$ has a minimum point but the proof is more involved. Since it can be carried out as in [26], we omit the details.

## 5. Appendix

All the technical proofs can be carried out as in [26]. Since they are quite involved, we rewrite some of them here by re-adapting the arguments to the present situation.
5.1. The rate of the error: proof of Lemma 4.1. By the property of $1^{*}$, we get

$$
\begin{equation*}
\left\|\mathcal{E}_{1}\right\|=O\left(\left|\left(U_{1}\right)^{\frac{N+2}{N-2}}-\left(P U_{1}\right)^{\frac{N+2}{N-2}}\right|_{\frac{2 N}{N+2}}\right)+O\left(\varepsilon\left|P U_{1}\right|_{\frac{2 N}{N+2}}\right) \tag{5.1}
\end{equation*}
$$

By Lemma 3.1 and scaling $x=\mu_{1} y$ we have that

$$
\left|P U_{1}\right|_{\frac{2 N}{N+2}} \leq\left|U_{1}\right|_{\frac{2 N}{N+2}}=\mu_{1}^{2}|U|_{\frac{2 N}{N+2}, \frac{\Omega}{\mu_{1}}}= \begin{cases}O\left(\mu_{1}^{\Gamma}\right) & \text { if } 1 \leq \Gamma<2  \tag{5.2}\\ O\left(\mu_{1}^{2} \log ^{\frac{N+2}{2 N}} \frac{1}{\mu_{1}}\right) & \text { if } \Gamma=2 \\ O\left(\mu_{1}^{2}\right) & \text { if } \Gamma>2\end{cases}
$$

in view of $\frac{2 \beta_{-}}{N+2}<1$ and $\frac{2 \beta_{+}}{N+2}=\frac{N-2+2 \Gamma}{N+2}$. Since $|a+b|^{\frac{N+2}{N-2}}-|a|^{\frac{N+2}{N-2}}=O\left(|a|^{\frac{4}{N-2}}|b|+|b|^{\frac{N+2}{N-2}}\right)$ for all $a, b \in \mathbb{R}$, we deduce that

$$
\begin{equation*}
\left|\left(U_{1}\right)^{\frac{N+2}{N-2}}-\left(P U_{1}\right)^{\frac{N+2}{N-2}}\right|_{\frac{2 N}{N+2}}=O\left(\left|U_{1}^{\frac{4}{N-2}}\left(P U_{1}-U_{1}\right)\right|_{\frac{2 N}{N+2}}+\left|P U_{1}-U_{1}\right|_{\frac{2 N}{N-2}}^{\frac{N+2}{N-2}}\right) . \tag{5.3}
\end{equation*}
$$

By Lemma 3.1 and scaling $x=\mu_{1} y$ we have that

$$
\begin{align*}
\left|U_{1}^{\frac{4}{N-2}}\left(P U_{1}-U_{1}\right)\right|_{\frac{2 N}{N+2}} & \leq c \mu_{1}^{\Gamma}\left|\frac{U_{1}^{\frac{4}{N-2}}}{|x|^{\beta-}}\right|_{\frac{2 N}{N+2}}=c\left(\mu_{1}\right)^{2 \Gamma}\left|\frac{U^{\frac{4}{N-2}}}{|y|^{\beta-}}\right|_{\frac{2 N}{N+2}, \frac{\Omega}{\mu_{1}}} \\
& = \begin{cases}O\left(\mu_{1}^{2 \Gamma}\right) & \text { if } 3 \leq N \leq 5 \\
O\left(\mu_{1}^{2 \Gamma} \log ^{\frac{2}{3}} \frac{1}{\mu_{1}}\right) & \text { if } N=6 \\
O\left(\mu_{1}^{\frac{N+2}{N-2} \Gamma}\right) & \text { if } N \geq 7\end{cases} \tag{5.4}
\end{align*}
$$

and

$$
\begin{equation*}
\left|P U_{1}-U_{1}\right|_{\frac{2 N}{N-2}}^{\frac{N+2}{N-2}}=O\left(\left|\frac{\mu_{1}^{\Gamma}}{|x|^{\beta-}}\right|_{\frac{2 N}{N-2}}^{\frac{N+2}{N-2}}\right)=O\left(\mu_{1}^{\frac{N+2}{N-2} \Gamma}\right), \tag{5.5}
\end{equation*}
$$

in view of $\frac{2 \beta_{-}}{N-2}<1$ and

$$
\begin{equation*}
\frac{2 N}{N+2}\left(\beta_{-}+\frac{4 \beta_{+}}{N-2}\right)=N-\frac{2 N(N-6)}{N^{2}-4} \Gamma . \tag{5.6}
\end{equation*}
$$

Inserting (5.4)-(5.5) into (5.3), by (5.1)-(5.2) we deduce the validity of (4.3).
Let us now consider the case $k \geq 2$ and assume $\Gamma>2$. For $\ell \geq 2$ we have that

$$
\begin{aligned}
\left\|\mathcal{E}_{\ell}\right\|= & \underbrace{O\left(\|\left.\sum_{j=1}^{\ell}(-1)^{j} P U_{j}\right|^{\frac{4}{N-2}} \sum_{j=1}^{\ell}(-1)^{j} P U_{j}-\left|\sum_{j=1}^{\ell-1}(-1)^{j} P U_{j}\right|^{\frac{4}{N-2}} \sum_{j=1}^{\ell-1}(-1)^{j} P U_{j}-\left.(-1)^{l}\left(P U_{\ell}\right)^{\frac{N+2}{N-2}}\right|_{\frac{2 N}{N+2}} ^{N+2}\right.}_{(I)}) \\
& +\underbrace{O\left(\left\lvert\,\left(U_{\ell}\right)^{\frac{N+2}{N-2}}-\left(P U_{\ell}\right)^{\left.\left.\frac{N+2}{N-2}\right|_{\frac{2 N}{N+2}}+\varepsilon\left|P U_{\ell}\right|_{\frac{2 N}{N+2}}^{N+2}\right)} .\right.\right.}_{(I I)}
\end{aligned}
$$

$(I I)$ is estimated as in (4.3) with $\mu_{1}$ replaced by $\mu_{l}$. As for $(I)$, let us introduce disjoint annuli $\mathcal{A}_{h}$ as

$$
\begin{equation*}
\mathcal{A}_{0}=\Omega \backslash B_{r}(0), \quad \mathcal{A}_{h}=B_{\sqrt{\mu_{h-1} \mu_{h}}}(0) \backslash B_{\sqrt{\mu_{h} \mu_{h+1}}}(0), h=1, \ldots, \ell \tag{5.7}
\end{equation*}
$$

where $\mu_{0}$ satisfies $\mu_{0} \mu_{1}=r^{2}$ with $r=\frac{1}{2} \operatorname{dist}(0, \partial \Omega)$ and $\mu_{\ell+1}=0$. Moreover define $\mu_{-1}$ so that $\mu_{-1} \mu_{0}=(\operatorname{diam} \Omega)^{2}$, in order to get $\mathcal{A}_{0} \subset B_{\sqrt{\mu_{-1} \mu_{0}}}(0) \backslash B_{\sqrt{\mu_{0} \mu_{1}}}(0)$. Since

$$
\begin{equation*}
|a+b|^{\frac{4}{N-2}}(a+b)-|a|^{\frac{4}{N-2}} a-\frac{N+2}{N-2}|a|^{\frac{4}{N-2}} b=O\left(|b|^{\frac{N+2}{N-2}}\right)+\underbrace{O\left(|a|^{\frac{6-N}{N-2}} b^{2}\right)}_{\text {if } 3 \leq N \leq 5} \tag{5.8}
\end{equation*}
$$

for all $a, b \in \mathbb{R}$, we have that

$$
\begin{align*}
& \|\left.\sum_{j=1}^{\ell}(-1)^{j} P U_{j}\right|^{\frac{4}{N-2}} \sum_{j=1}^{\ell}(-1)^{j} P U_{j}-\left|\sum_{j=1}^{\ell-1}(-1)^{j} P U_{j}\right|^{\frac{4}{N-2}} \sum_{j=1}^{\ell-1}(-1)^{j} P U_{j}-\left.(-1)^{l}\left(P U_{\ell}\right)^{\frac{N+2}{N-2}}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{h}} \\
& = \begin{cases}O\left(\sum_{j=1}^{\ell-1}\left|\left(P U_{j}\right)^{\frac{4}{N-2}} P U_{\ell}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{h}}+\left|P U_{\ell}\right|_{\frac{2 N}{N-2}}^{\frac{N+\mathcal{A}_{h}}{N-2}}\right) \quad \text { if } h=0, \ldots, l-1 \\
O\left(\sum_{j=1}^{\ell-1}\left|\left(P U_{\ell}\right)^{\frac{4}{N-2}} P U_{j}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{\ell}}+\sum_{j=1}^{\ell-1}\left|P U_{j}\right|_{\frac{2 N}{N-2}, \mathcal{A}_{\ell}}^{\frac{N+2}{N-2}}\right) & \text { if } h=l .\end{cases} \tag{5.9}
\end{align*}
$$

Hereafter we will repeatedly use that $\mu_{1} \gg \ldots \gg \mu_{k}$. Since $\frac{2 \beta_{-}}{N-2}<1<\frac{2 \beta_{+}}{N-2}$, by Lemma 3.1 and scaling $x=\mu_{i} y$ we have that

$$
\left|P U_{j}\right|_{\frac{2 N}{N-2}, \mathcal{A}_{h}} \leq\left|U_{j}\right|_{\frac{2 N}{N-2}, \mathcal{A}_{h}}=|U|_{\frac{2 N}{N-2}, \frac{\mathcal{A}_{h}}{\mu_{j}}}=\left\{\begin{array}{ll}
O\left(\left(\frac{\mu_{\ell}}{\sqrt{\mu_{h} \mu_{h+1}}}\right)^{\Gamma}\right) & \text { if } j=\ell  \tag{5.10}\\
O\left(\left(\frac{\sqrt{\mu_{l-1} \mu_{l}}}{\mu_{j}}\right)^{\Gamma}\right) & \text { if } h=\ell
\end{array}=O\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\frac{\Gamma}{2}}\right)\right.
$$

for any $j=1, \ldots, \ell$ and $h=0, \ldots, \ell$ with $\max \{j, h\}=\ell, j \neq h$. Since $|x| \gg \mu_{l}$ in $\mathcal{A}_{h}$, for any $j=1, \ldots, \ell-1$ and $h=0, \ldots, \ell-1$ by Lemma 3.1 we have

$$
\begin{align*}
\left|\left(P U_{j}\right)^{\frac{4}{N-2}} P U_{\ell}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{h}} & \leq\left|U_{j}^{\frac{4}{N-2}} U_{\ell}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{h}} \leq c \mu_{l}^{\Gamma}\left|\frac{U_{j}^{\frac{4}{N-2}}}{|x|^{\beta_{+}}}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{h}}  \tag{5.11}\\
& =c\left(\frac{\mu_{l}}{\mu_{j}}\right)^{\Gamma}\left|\frac{U^{\frac{4}{N-2}}}{|y|^{\beta_{+}}}\right|_{\frac{2 N}{N+2}, \frac{\mathcal{A}_{h}}{\mu_{j}}}=O\left(\left(\frac{\mu_{l}}{\mu_{l-1}}\right)^{\Gamma}\right)
\end{align*}
$$

when $3 \leq N \leq 5$ and

$$
\begin{align*}
& \left|\left(P U_{j}\right)^{\frac{4}{N-2}} P U_{\ell}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{h}} \leq\left|U_{j}^{\frac{4}{N-2}} U_{\ell}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{h}} \leq c \mu_{j}^{-\frac{4 \Gamma}{N-2}}\left|\frac{U_{l}}{|x|^{\frac{4 \beta-}{N-2}}}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{h}} \\
& =c\left(\frac{\mu_{l}}{\mu_{j}}\right)^{\frac{4 \Gamma}{N-2}}\left|\frac{U}{|y|^{\frac{4 \beta-}{N-2}}}\right|_{\frac{2 N}{N+2}, \frac{\mathcal{A}_{h}}{\mu_{l}}} \leq c\left(\frac{\mu_{l}}{\mu_{j}}\right)^{\frac{4 \Gamma}{N-2}} \begin{cases}\log ^{\frac{2}{3}} \frac{\sqrt{\mu_{h-1} \mu_{h}}}{\mu_{l}} & \text { if } N=6 \\
\left(\frac{\mu_{l}}{\sqrt{\mu_{h} \mu_{h+1}}}\right)^{\frac{N-6}{N-2} \Gamma} & \text { if } N \geq 7\end{cases}  \tag{5.12}\\
& =O\left(\left(\frac{\mu_{l}}{\mu_{l-1}}\right)^{\frac{N+2}{N-2} \frac{\Gamma}{2}} \log ^{\frac{2}{3}} \frac{1}{\mu_{l}}\right)
\end{align*}
$$

when $N \geq 6$, in view of $\frac{2 \beta_{-}}{N-2}<1<\frac{2 \beta_{+}}{N-2}$ and

$$
\frac{2 N}{N+2}\left(\frac{4 \beta_{-}}{N-2}+\beta_{+}\right)=N+\frac{2 N(N-6)}{N^{2}-4} \Gamma
$$

Similarly, for $j=1, \ldots, l-1$ we have that

$$
\begin{align*}
\left|\left(P U_{l}\right)^{\frac{4}{N-2}} P U_{j}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{l}} & \leq\left|U_{l}^{\frac{4}{N-2}} U_{j}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{l}} \leq c \mu_{j}^{-\Gamma}\left|\frac{U_{l}^{\frac{4}{N-2}}}{|x|^{\beta_{-}}}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{l}}  \tag{5.13}\\
& =c\left(\frac{\mu_{l}}{\mu_{j}}\right)^{\Gamma}\left|\frac{U^{\frac{4}{N-2}}}{|y|^{\beta_{-}}}\right|_{\frac{2 N}{N+2}, \frac{\mathcal{A}_{l}}{\mu_{l}}}=O\left(\left(\frac{\mu_{l}}{\mu_{l-1}}\right)^{\Gamma}\right)
\end{align*}
$$

when $3 \leq N \leq 5$ and

$$
\begin{align*}
& \left|\left(P U_{l}\right)^{\frac{4}{N-2}} P U_{j}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{l}} \leq\left|U_{l}^{\frac{4}{N}^{\frac{4}{2}}} U_{j}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{l}} \leq c \mu_{l}^{\frac{4 \Gamma}{N-2}}\left|\frac{U_{j}}{|x|^{\frac{4 \beta_{+}+2}{N-2}}}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{l}} \\
& =\left.c\left(\frac{\mu_{l}}{\mu_{j}}\right)^{\frac{4 \Gamma}{N-2}}\right|_{|y|^{\frac{4 \beta_{+}+}{N-2}}} ^{\left.\right|_{\frac{2 N}{N+2}} ^{N}, \frac{A_{l}}{\mu_{j}}} \quad \leq c\left(\frac{\mu_{l}}{\mu_{i}}\right)^{\frac{4 \Gamma}{N-2}} \begin{cases}\log ^{\frac{2}{3}} \frac{\mu_{j}}{\sqrt{\mu_{l-1}-\mu_{l}}} & \text { if } N=6 \\
\left(\frac{\sqrt{\mu_{l}-1 \mu_{l}}}{\mu_{j}}\right)^{N-2} N & \text { if } N \geq 7\end{cases}  \tag{5.14}\\
& =O\left(\left(\frac{\mu_{l}}{\mu_{l-1}}\right)^{\frac{N+2}{N-2} \frac{\Gamma}{2}} \log ^{\frac{2}{3}} \frac{1}{\mu_{l}}\right)
\end{align*}
$$

when $N \geq 6$ in view of $\frac{2 \beta_{-}}{N-2}<1$ and (5.6). By inserting (5.10)-(5.14) into (5.9) we deduce an estimate of $(I)$ which, along with the estimate on $(I I)$ in terms of $\mu_{\ell}$, leads to the validity of (4.4).
5.2. The reduced energy: proof of (4.9)-(4.10). To get an expansion of $J_{\varepsilon}\left(\mu_{1}, \ldots, \mu_{k}\right)$, let us first write that

$$
\begin{aligned}
& J_{\varepsilon}\left(\sum_{\ell=1}^{k}(-1)^{\ell} P U_{\ell}\right)=\sum_{\ell=1}^{k} J_{\varepsilon}\left(P U_{\ell}\right)+\sum_{i<\ell}(-1)^{i+\ell} \int_{\Omega}\left[U_{\ell}^{\frac{N+2}{N-2}}-\varepsilon P U_{\ell}-\left(P U_{\ell}\right)^{\frac{N+2}{N-2}}\right] P U_{i} d x \\
& -\frac{N-2}{2 N} \int_{\Omega}\left[\left|\sum_{\ell=1}^{k}(-1)^{\ell} P U_{\ell}\right|^{\frac{2 N}{N-2}}-\sum_{\ell=1}^{k}\left(P U_{\ell}\right)^{\frac{2 N}{N-2}}-\frac{2 N}{N-2} \sum_{i<\ell}(-1)^{i+\ell}\left(P U_{\ell}\right)^{\frac{N+2}{N-2}} P U_{i}\right] d x
\end{aligned}
$$

in view of $P U_{\ell}=1^{*}\left(U_{\ell}^{\frac{N+2}{N-2}}\right)$. Introducing the quantities

$$
\begin{aligned}
a_{\ell}= & J_{\varepsilon}\left(P U_{\ell}\right)+\sum_{i=1}^{\ell-1}(-1)^{i+\ell} \int_{\Omega}\left[U_{\ell}^{\frac{N+2}{N-2}}-\varepsilon P U_{\ell}-\left(P U_{\ell}\right)^{\frac{N+2}{N-2}}\right] P U_{i} d x \\
& -\frac{N-2}{2 N} \int_{\Omega}\left[\left|\sum_{i=1}^{\ell}(-1)^{i} P U_{i}\right|^{\frac{2 N}{N-2}}-\left|\sum_{i=1}^{\ell-1}(-1)^{i} P U_{i}\right|^{\frac{2 N}{N-2}}-\left(P U_{\ell}\right)^{\frac{2 N}{N-2}}-\frac{2 N}{N-2} \sum_{i=1}^{\ell-1}(-1)^{i+\ell}\left(P U_{\ell}\right)^{\frac{N+2}{N-2}} P U_{i}\right] d x
\end{aligned}
$$

for any $\ell=1, \ldots, k$, let us notice that each $a_{\ell}$ only depends on $d_{1}, \ldots, d_{\ell}$ and the following decomposition does hold:

$$
\begin{equation*}
J_{\varepsilon}\left(\sum_{\ell=1}^{k}(-1)^{\ell} P U_{\ell}\right)=\sum_{\ell=1}^{k} a_{\ell} \tag{5.15}
\end{equation*}
$$

We claim that

$$
a_{1}=A_{1}+A_{2} m \mu_{1}^{2 \Gamma}(1+o(1))-A_{3} \varepsilon(1+o(1)) \begin{cases}\mu_{1}^{2} \log \frac{1}{\mu_{1}} & \text { if } \Gamma=1  \tag{5.16}\\ \mu_{1}^{2} & \text { if } \Gamma>1\end{cases}
$$

and

$$
\begin{equation*}
a_{\ell}=A_{1}+A_{4}\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}(1+o(1))-A_{3} \varepsilon \mu_{\ell}^{2}(1+o(1)), \ell=2, \ldots, k \tag{5.17}
\end{equation*}
$$

where $m>0$ is the Hardy interior mass of $\Omega$ associated to $L_{\gamma}$ and $A_{1}, \ldots, A_{4}>0$. Inserting (5.16)-(5.17) into (5.15), we deduce the validity of (4.9)-(4.10).

To compute $J_{\varepsilon}\left(P U_{\ell}\right)$, let us first write

$$
\begin{align*}
J_{\varepsilon}\left(P U_{\ell}\right) & =\frac{1}{N} \int_{\Omega} U_{\ell}^{\frac{2 N}{N-2}} d x-\frac{1}{2} \int_{\Omega} U_{\ell}^{\frac{N+2}{N-2}}\left(P U_{\ell}-U_{\ell}\right) d x-\frac{\varepsilon}{2} \int_{\Omega} P U_{\ell}^{2} d x \\
& -\frac{N-2}{2 N} \int_{\Omega}\left[\left(P U_{\ell}\right)^{\frac{2 N}{N-2}}-U_{\ell}^{\frac{2 N}{N-2}}-\frac{2 N}{N-2} U_{\ell}^{\frac{N+2}{N-2}}\left(P U_{\ell}-U_{\ell}\right)\right] d x \tag{5.18}
\end{align*}
$$

in view of $P U_{\ell}=1^{*}\left(U_{\ell}^{\frac{N+2}{N-2}}\right)$. We have that

$$
\begin{equation*}
\int_{\Omega} U_{\ell}^{\frac{2 N}{N-2}} d x=\int_{\mathbb{R}^{N}} U^{\frac{2 N}{N-2}} d y+O\left(\mu_{\ell}^{\frac{2 N}{N-2} \Gamma}\right) \tag{5.19}
\end{equation*}
$$

and by Lemma 3.1 and (3.7) we deduce that

$$
\begin{align*}
\int_{\Omega} U_{\ell}^{\frac{N+2}{N-2}}\left(P U_{\ell}-U_{\ell}\right) d x & =-\alpha_{N} \mu_{\ell}^{\Gamma} \int_{\Omega} U_{\ell}^{\frac{N+2}{N-2}}\left[H_{\gamma}(x)+O\left(\frac{\mu_{\ell}^{\frac{4 \Gamma}{N-2}}}{|x|^{\beta_{-}}}\right)\right] d x  \tag{5.20}\\
& =-\alpha_{N} m \mu_{\ell}^{2 \Gamma} \int_{\mathbb{R}^{N}} \frac{U^{\frac{N+2}{N-2}}}{|y|^{\beta_{-}}} d y(1+o(1))
\end{align*}
$$

and

$$
\begin{align*}
\int_{\Omega} P U_{\ell}^{2} d x & =\int_{\Omega} U_{\ell}^{2} d x+O\left(\int_{\Omega} U_{\ell} \frac{\mu_{\ell}^{\Gamma}}{|x|^{\beta_{-}}} d x\right)=\mu_{\ell}^{2} \int_{\frac{\Omega}{\mu_{\ell}}} U^{2} d y+O\left(\mu_{\ell}^{2 \Gamma} \int_{\Omega} \frac{d x}{|x|^{N-2}}\right)  \tag{5.21}\\
& = \begin{cases}\mu_{\ell}^{2} \log \frac{1}{\mu_{\ell}}\left[\alpha_{N}^{2} \omega_{N-1}+o(1)\right] & \text { if } \Gamma=1 \\
\mu_{\ell}^{2}\left[\int_{\mathbb{R}^{N}} U^{2} d y+o(1)\right] & \text { if } \Gamma>1\end{cases}
\end{align*}
$$

in view of $\frac{2 N \beta_{-}}{N-2}<N<\beta_{-}+\frac{N+2}{N-2} \beta_{+}$and $2 \beta_{ \pm}=N-2 \pm 2 \Gamma$. Since

$$
\begin{equation*}
|a+b|^{\frac{2 N}{N-2}}-|a|^{\frac{2 N}{N-2}}-\frac{2 N}{N-2}|a|^{\frac{4}{N-2}} a b=O\left(|a|^{\frac{4}{N-2}} b^{2}+|b|^{\frac{2 N}{N-2}}\right) \tag{5.22}
\end{equation*}
$$

for all $a, b \in \mathbb{R}$, by Lemma 3.1 we finally deduce

$$
\begin{align*}
& \int_{\Omega}\left[\left(P U_{\ell}\right)^{\frac{2 N}{N-2}}-U_{\ell}^{\frac{2 N}{N-2}}-\frac{2 N}{N-2} U_{\ell}^{\frac{N+2}{N-2}}\left(P U_{\ell}-U_{\ell}\right)\right] d x \\
& =O\left(\int_{\Omega}\left|P U_{\ell}-U_{\ell}\right|^{\frac{2 N}{N-2}} d x+\int_{\Omega} U_{\ell}^{\frac{4}{N-2}}\left(P U_{\ell}-U_{\ell}\right)^{2} d x\right)=O\left(\mu_{\ell}^{\frac{2 N}{N-2} \Gamma}+\mu_{\ell}^{2 \Gamma} \int_{\Omega} \frac{U_{\ell}^{\frac{4}{N-2}}}{|x|^{2 \beta_{-}}}\right)  \tag{5.23}\\
& =\left\{\begin{array}{ll}
O\left(\mu_{\ell}^{\frac{2 N}{N-2} \Gamma}+\mu_{\ell}^{4 \Gamma} \int_{B} \frac{R}{\mu_{\ell}}(0) \frac{U^{\frac{4}{N-2}}}{|y|^{2 \beta-}} d y\right) & \text { if } 3 \leq N \leq 4 \\
O\left(\mu_{\ell}^{\frac{2 N}{N-2} \Gamma}+\mu_{\ell}^{\frac{2 N}{N-2}} \int_{\Omega} \frac{d x}{|x|^{\frac{4 \beta}{N-2}+2 \beta_{-}}}\right) & \text {if } N \geq 5
\end{array}=o\left(\mu_{\ell}^{2 \Gamma}\right)\right.
\end{align*}
$$

in view of $\frac{2 \beta_{-}}{N-2}<1$ and $\frac{4 \beta_{+}}{N-2}+2 \beta_{-}=N-2 \frac{N-4}{N-2} \Gamma$. Inserting (5.19)-(5.21) and (5.23) into (5.18) we get the validity of (5.16) for $a_{1}=J_{\varepsilon}\left(P U_{1}\right)$.

Hereafter let us consider the case $k \geq 2$ with $\Gamma>2$. As for $\ell=1$ in (5.16), the following expansion does hold

$$
\begin{equation*}
J_{\varepsilon}\left(P U_{\ell}\right)=A_{1}+A_{2} m \mu_{\ell}^{2 \Gamma}(1+o(1))-A_{3} \varepsilon \mu_{\ell}^{2}(1+o(1)), \quad \ell=1, \ldots, k \tag{5.24}
\end{equation*}
$$

Let $\ell \geq 2$. Since

$$
U_{\ell}^{\frac{4}{N-2}}=O\left(\left(\frac{\mu_{\ell}^{\Gamma}}{|x|^{\beta_{+}}}\right)^{\frac{5}{2(N-2)}}\left(\frac{1}{\mu_{\ell}^{\Gamma}|x|^{\beta_{-}}}\right)^{\frac{3}{2(N-2)}}\right)=O\left(\frac{\mu_{\ell}^{\frac{\Gamma}{N-2}}}{|x|^{\frac{5}{2(N-2)} \beta_{+}+\frac{3}{2(N-2)} \beta_{-}}}\right)
$$

by Lemma 3.1 and (5.8) we have that for any $i=1, \ldots, \ell-1$

$$
\begin{aligned}
& \int_{\Omega}\left[U_{\ell}^{\frac{N+2}{N-2}}-\varepsilon P U_{\ell}-\left(P U_{\ell}\right)^{\frac{N+2}{N-2}}\right] P U_{i} d x \\
& =O\left(\mu_{\ell}^{\frac{N+2}{N-2} \Gamma} \int_{\Omega} \frac{U_{i}}{|x|^{\frac{N+2}{N-2} \beta_{-}}} d x+\mu_{\ell}^{\Gamma} \int_{\Omega} \frac{U_{\ell}^{\frac{4}{N-2}} U_{i}}{|x|^{\beta_{-}}} d x+\varepsilon \int_{\Omega} U_{i} U_{\ell} d x\right) \\
& =O\left(\int_{\Omega} \frac{\mu_{\ell}^{\frac{N+2}{N-2} \Gamma} \mu_{i}^{\Gamma}}{|x|^{N+2} N-2} \beta_{-}+\beta_{+}\right. \\
& \left.=\left(\frac{\mu_{\ell}}{\mu_{i}}\right)^{\Gamma} \mu_{\ell}^{\frac{\Gamma}{N-2}} \int_{\Omega} \frac{d x}{|x|^{\frac{4 N-5}{2(N-2)} \beta_{-}+\frac{5}{2(N-2)} \beta_{+}}}+\varepsilon\left(\frac{\mu_{\ell}}{\mu_{i}}\right)^{\Gamma} \int_{\Omega} \frac{d x}{|x|^{\beta_{-}+\beta_{+}}}\right)
\end{aligned}
$$

and then

$$
\begin{equation*}
\int_{\Omega}\left[U_{\ell}^{\frac{N+2}{N-2}}-\varepsilon P U_{\ell}-\left(P U_{\ell}\right)^{\frac{N+2}{N-2}}\right] P U_{i} d x=o\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}\right) \tag{5.25}
\end{equation*}
$$

in view of (3.10)-(3.11) and

$$
\begin{equation*}
\frac{N+2}{N-2} \beta_{-}+\beta_{+}<N, \quad \frac{4 N-5}{2(N-2)} \beta_{-}+\frac{5}{2(N-2)} \beta_{+}<N \tag{5.26}
\end{equation*}
$$

In order to expand the last term in $a_{\ell}, \ell=2, \ldots, k$, let us split $\Omega$ as $\Omega=\bigcup_{h=0}^{\ell} \mathcal{A}_{h}(\operatorname{see}(5.7))$, and for $h=0, \ldots, \ell$ set

$$
I_{h}=\int_{\mathcal{A}_{h}}\left[\left|\sum_{i=1}^{\ell}(-1)^{i} P U_{i}\right|^{\frac{2 N}{N-2}}-\left|\sum_{i=1}^{\ell-1}(-1)^{i} P U_{i}\right|^{\frac{2 N}{N-2}}-\left(P U_{\ell}\right)^{\frac{2 N}{N-2}}-\frac{2 N}{N-2} \sum_{i=1}^{\ell-1}(-1)^{i+\ell}\left(P U_{\ell}\right)^{\frac{N+2}{N-2}} P U_{i}\right] d x .
$$

By (5.10), (5.13)-(5.14) and (5.22) we deduce that

$$
\begin{align*}
I_{\ell} & =O\left(\sum_{i=1}^{\ell-1} \int_{\mathcal{A}_{\ell}}\left[\left(P U_{i}\right)^{\frac{2 N}{N-2}}+\left(P U_{i}\right)^{2} P U_{\ell}^{\frac{4}{N-2}}\right] d x\right) \\
& =O\left(\sum_{i=1}^{\ell-1}\left|P U_{i}\right|_{\frac{2 N}{N-2}, \mathcal{A}_{\ell}}^{\frac{2 N}{N-2}}+\sum_{i=1}^{\ell-1}\left|P U_{i}\right|_{\frac{2 N}{N-2}, \mathcal{A}_{\ell}}\left|P U_{\ell}^{\frac{4}{N-2}} P U_{i}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{\ell}}\right)=o\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}\right) . \tag{5.27}
\end{align*}
$$

For $h=0, \ldots, \ell-1$ by (5.8) and (5.22) we get that

$$
\begin{aligned}
& I_{h}=\frac{2 N}{N-2} \int_{\mathcal{A}_{h}}\left[\left|\sum_{i=1}^{\ell-1}(-1)^{i} P U_{i}\right|^{\frac{4}{N-2}} \sum_{i=1}^{\ell-1}(-1)^{i} P U_{i}\right](-1)^{\ell} P U_{\ell} d x \\
& +O\left(\int_{\mathcal{A}_{h}} \sum_{i=1}^{\ell-1}\left[\left(P U_{i}\right)^{\frac{4}{N-2}}\left(P U_{l}\right)^{2}+\left(P U_{l}\right)^{\frac{N+2}{N-2}} P U_{i}\right] d x+\int_{\mathcal{A}_{h}}\left(P U_{l}\right)^{\frac{2 N}{N-2}} d x\right) \\
& =-\frac{2 N}{N-2} \int_{\mathcal{A}_{h}}\left(P U_{\ell-1}\right)^{\frac{N+2}{N-2}} P U_{\ell} d x+O\left(\int_{\mathcal{A}_{h}} \sum_{i=1}^{\ell-2}\left[\left(P U_{\ell-1}\right)^{\frac{4}{N-2}} P U_{i} P U_{\ell}+\left(P U_{i}\right)^{\frac{N+2}{N-2}} P U_{\ell}\right] d x\right) \\
& +O\left(\int_{\mathcal{A}_{h}} \sum_{i=1}^{\ell-1}\left[\left(P U_{i}\right)^{\frac{4}{N-2}}\left(P U_{l}\right)^{2}+\left(P U_{l}\right)^{\frac{N+2}{N-2}} P U_{i}\right] d x+\int_{\mathcal{A}_{h}}\left(P U_{l}\right)^{\frac{2 N}{N-2}} d x\right) .
\end{aligned}
$$

Since $\beta_{-}+\frac{N+2}{N-2} \beta_{+}=N+\frac{4 \Gamma}{N-2}>N$, by Lemma 3.1 and (5.26) we deduce that

$$
\begin{aligned}
& \int_{\mathcal{A}_{h}}\left(P U_{\ell-1}\right)^{\frac{4}{N-2}} P U_{i} P U_{\ell}=O\left(\left(\frac{\mu_{\ell}}{\mu_{i}}\right)^{\Gamma} \int_{\mathcal{A}_{h}} \frac{U_{\ell-1}^{\frac{4}{N-2}}}{|x|^{N-2}} d x\right)=O\left(\left(\frac{\mu_{\ell}}{\mu_{i}}\right)^{\Gamma} \int_{\frac{\mathcal{A}_{h}}{\mu_{\ell-1}}} \frac{U^{\frac{4}{N-2}}}{|y|^{N-2}} d y\right)=O\left(\left(\frac{\mu_{\ell}}{\mu_{i}}\right)^{\Gamma}\right) \\
& \int_{\mathcal{A}_{h}}\left(P U_{i}\right)^{\frac{N+2}{N-2}} P U_{\ell} d x=O\left(\mu_{\ell}^{\Gamma} \int_{\mathcal{A}_{h}} \frac{U_{i}^{\frac{N+2}{N-2}}}{|x|^{\beta_{+}}} d x\right)=O\left(\left(\frac{\mu_{\ell}}{\mu_{i}}\right)^{\Gamma} \int_{\frac{\mathcal{A}_{h}}{\mu_{i}}} \frac{U^{\frac{N+2}{N-2}}}{|y|^{\beta_{+}}} d y\right)=O\left(\left(\frac{\mu_{\ell}}{\mu_{i}}\right)^{\Gamma}\right) \\
& \int_{\mathcal{A}_{h}}\left(P U_{\ell}\right)^{\frac{N+2}{N-2}} P U_{i} d x=O\left(\frac{1}{\mu_{i}^{\Gamma}} \int_{\mathcal{A}_{h}} \frac{U_{\ell}^{\frac{N+2}{N-2}}}{|x|^{\beta_{-}}} d x\right)=O\left(\left(\frac{\mu_{\ell}}{\mu_{i}}\right)^{\Gamma} \int_{\frac{\mathcal{A}_{h}}{\mu_{\ell}}} \frac{U^{\frac{N+2}{N-2}}}{|y|^{\beta_{-}}} d y\right)=O\left(\left(\frac{\mu_{\ell}}{\mu_{i}}\right)^{\Gamma}\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\frac{2 \Gamma}{N-2}}\right)
\end{aligned}
$$

for any $i=1, \ldots, \ell-1$ and $h=0, \ldots, \ell-1$, which inserted into the previous expression for $I_{h}$ give that

$$
\begin{align*}
I_{h} & =-\frac{2 N}{N-2} \int_{\mathcal{A}_{h}}\left(P U_{\ell-1}\right)^{\frac{N+2}{N-2}} P U_{\ell} d x+O\left(\int_{\mathcal{A}_{h}} \sum_{i=1}^{\ell-1}\left(P U_{i}\right)^{\frac{4}{N-2}}\left(P U_{l}\right)^{2} d x+\int_{\mathcal{A}_{h}}\left(P U_{l}\right)^{\frac{2 N}{N-2}} d x\right) \\
& +o\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}\right)=-\frac{2 N}{N-2} \int_{\mathcal{A}_{h}}\left(P U_{\ell-1}\right)^{\frac{N+2}{N-2}} P U_{\ell} d x \\
& +O\left(\int_{\mathcal{A}_{h}} \sum_{i=1}^{\ell-1}\left|\left(P U_{i}\right)^{\frac{4}{N-2}} P U_{l}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{h}}\left|P U_{l}\right|_{\frac{2 N}{N-2}, \mathcal{A}_{h}}+\left|P U_{l}\right|_{\frac{2 N}{N-2}}^{\frac{2 N}{N-2}, \mathcal{A}_{h}}\right)+o\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}\right) \\
& =-\frac{2 N}{N-2} \int_{\mathcal{A}_{h}}\left(P U_{\ell-1}\right)^{\frac{N+2}{N-2}} P U_{\ell} d x+o\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}\right) \tag{5.28}
\end{align*}
$$

for $h=0, \ldots, \ell-1$ in view of (5.10)-(5.12). By (5.8) and Lemma 3.1 we have that

$$
\begin{equation*}
\int_{\mathcal{A}_{h}}\left(P U_{\ell-1}\right)^{\frac{N+2}{N-2}} P U_{\ell} d x=O\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma} \int_{\frac{\mathcal{A}_{h}}{\mu_{\ell-1}}} \frac{U^{\frac{N+2}{N-2}}}{|y|^{\beta_{+}}} d y\right)=o\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}\right) \tag{5.29}
\end{equation*}
$$

for $h=0, \ldots, \ell-2$ and

$$
\begin{align*}
& \int_{\mathcal{A}_{\ell-1}}\left(P U_{\ell-1}\right)^{\frac{N+2}{N-2}} P U_{\ell} d x \\
& =\int_{\mathcal{A}_{\ell-1}} U_{\ell-1}^{\frac{N+2}{N-2}} U_{\ell} d x+O\left(\int_{\mathcal{A}_{\ell-1}}\left[\mu_{\ell-1}^{\Gamma} \frac{\left(U_{\ell-1}\right)^{\frac{4}{N-2}} U_{\ell}}{|x|^{\beta_{-}}}+\mu_{\ell-1}^{\frac{N+2}{N-2} \Gamma} \frac{U_{\ell}}{|x|^{\frac{N+2}{N-2} \beta_{-}}}+\mu_{\ell}^{\Gamma} \frac{U_{\ell-1}^{\frac{N+2}{N-2}}}{|x|^{\beta_{-}}}\right] d x\right) \\
& =\left(\frac{\mu_{\ell-1}}{\mu_{\ell}}\right)^{\frac{N-2}{2}} \int_{\frac{\mathcal{A}_{\ell-1}}{\mu_{\ell-1}}} U^{\frac{N+2}{N-2}} U\left(\frac{\mu_{\ell-1}}{\mu_{\ell}} y\right) d y+O\left(\mu_{\ell-1}^{\Gamma} \int_{\mathcal{A}_{\ell-1}} \frac{\left(U_{\ell-1}\right)^{\frac{4}{N-2}} U_{\ell}}{|x|^{\beta_{-}}} d x\right)  \tag{5.30}\\
& +O\left(\mu_{\ell-1}^{\frac{N+2}{N-2} \Gamma} \mu_{\ell}^{\Gamma} \int_{\mathcal{A}_{\ell-1}} \frac{d x}{|x|^{\frac{N+2}{N-2} \beta-+\beta_{+}}}\right)+O\left(\mu_{\ell}^{\Gamma}\right)\left(\int_{\mathcal{A}_{\ell-1}} \frac{d x}{|x|^{\frac{2 N \beta_{-}}{N-2}}}\right)^{\frac{N-2}{2 N}} \\
& =\alpha_{N}\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma} \int_{\mathbb{R}^{N}} \frac{U^{\frac{N+2}{N-2}}}{|y|^{\beta_{+}}} d y+o\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}\right)
\end{align*}
$$

in view of $\frac{\mu_{\ell-1}}{\mu_{\ell}} y \geq \sqrt{\frac{\mu_{\ell-1}}{\mu_{\ell}}} \rightarrow+\infty$ for all $y \in \frac{\mathcal{A}_{\ell-1}}{\mu_{\ell-1}},(5.26)$ and

$$
\int_{\mathcal{A}_{\ell-1}} \frac{U_{\ell-1}^{\frac{4}{N-2}} U_{\ell}}{|x|^{\beta_{-}}}= \begin{cases}O\left(\left|U_{\ell-1}^{\frac{4}{N-2}} U_{\ell}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{\ell-1}}\right)=O\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}\right) & \text { if } 3 \leq N \leq 5  \tag{5.31}\\ O\left(\frac{\mu_{\ell}^{\Gamma}}{\mu_{\ell-1}^{N-2}} \int_{\mathcal{A}_{\ell-1}} \frac{d x}{|x|^{\frac{N+2}{N-2} \beta_{-}+\beta_{+}}}\right)=O\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}\right) & \text { if } N \geq 6\end{cases}
$$

thanks to (5.11). Therefore, inserting (5.29)-(5.30) into (5.28) we have the following expansion:

$$
\begin{equation*}
I_{h}=o\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}\right), \quad I_{\ell-1}=-\frac{2 N}{N-2} A_{4}\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}+o\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}\right) . \tag{5.32}
\end{equation*}
$$

Summing up (5.27) and (5.32) we get that the third term in $a_{\ell}, \ell=2, \ldots, k$, takes the form

$$
-\frac{N-2}{2 N} \sum_{h=0}^{\ell} I_{h}=A_{4}\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}+o\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}\right)
$$

which, along with (5.24)-(5.25), finally establishes the validity of (5.17) for $a_{\ell}, \ell=2, \ldots, k$.
5.3. The remainder term: proof of Proposition 4.3. We assume that either $\ell=1$ or $\ell \geq 2$ and $C^{1}$-maps $\left(d_{1}, \ldots, d_{k}\right) \in A \rightarrow \phi_{j, \varepsilon}\left(d_{1}, \ldots, d_{j}\right) \in \mathcal{K}_{j}^{\perp}$ have already been constructed for $j=$ $1, \ldots, \ell-1$ satisfying the properties of Proposition 4.3. By Lemma 4.2 we can rewrite the equation $\mathcal{E}_{\ell}+\mathcal{L}_{\ell}\left(\phi_{\ell}\right)+\mathcal{N}_{\ell}\left(\phi_{1, \varepsilon}, \ldots, \phi_{\ell-1, \varepsilon}, \phi_{\ell}\right)=0$ as

$$
\phi_{\ell}=-\mathcal{L}_{\ell}^{-1}\left(\mathcal{E}_{\ell}+\mathcal{N}_{\ell}\left(\phi_{1, \varepsilon}, \ldots, \phi_{\ell-1, \varepsilon}, \phi_{\ell}\right)\right)=\mathcal{T}_{\ell}\left(\phi_{\ell}\right)
$$

Given $R>0$ large, we show below that $\mathcal{T}_{\ell}: \mathcal{B}_{\ell} \rightarrow \mathcal{B}_{\ell}=\left\{\phi \in \mathcal{K}_{\ell}^{\perp}:\|\phi\| \leq R R_{\ell}\right\}$ is a contraction mapping for $\varepsilon$ small, where

$$
R_{\ell}= \begin{cases}\left\|\mathcal{E}_{1}\right\| & \text { if } \ell=1  \tag{5.33}\\ \left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}+\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\frac{\Gamma}{2}+1}+\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\frac{N+2}{2(N-2)} \Gamma} \log ^{\frac{2}{3}} \frac{1}{\mu_{\ell}} & \text { if } \ell=2, \ldots, k .\end{cases}
$$

Hence, for $\epsilon>0$ small it follows the existence of a unique fixed point $\phi_{\ell, \varepsilon}\left(d_{1}, \ldots, d_{\ell}\right) \in \mathcal{B}_{\ell}$ for any $\left(d_{1}, \ldots, d_{k}\right) \in A$. By the Implicit Function Theorem it is possible to show that $\left(d_{1}, \ldots, d_{k}\right) \in A \rightarrow$ $\phi_{\ell, \varepsilon}\left(d_{1}, \ldots, d_{\ell}\right)$ is a $C^{1}$-map satisfying also (4.7). Since the proof can be made similarly as in [26] we omit it. The validity of (4.8) will be addressed at the end of this section.

Set $\mathcal{N}_{\ell}(\phi)=\mathcal{N}_{\ell}\left(\phi_{1, \varepsilon}, \ldots, \phi_{\ell-1, \varepsilon}, \phi\right)$. Since by Lemma 4.2

$$
\left\|\mathcal{T}_{\ell}(\phi)\right\| \leq c\left(\left\|\mathcal{E}_{\ell}\right\|+\left\|\mathcal{N}_{\ell}(\phi)\right\|\right), \quad\left\|\mathcal{T}_{\ell}\left(\phi_{1}\right)-\mathcal{T}_{\ell}\left(\phi_{2}\right)\right\| \leq c\left\|\mathcal{N}_{\ell}\left(\phi_{1}\right)-\mathcal{N}_{\ell}\left(\phi_{2}\right)\right\|
$$

by Lemma 4.1 and (3.10)-(3.13) it is enough to show that

$$
\begin{equation*}
\left\|\mathcal{N}_{\ell}(\phi)\right\|=O\left(R_{\ell}\right)+o(\|\phi\|), \quad\left\|\mathcal{N}_{\ell}\left(\phi_{1}\right)-\mathcal{N}_{\ell}\left(\phi_{2}\right)\right\|=o(1)\left\|\phi_{1}-\phi_{2}\right\| \tag{5.34}
\end{equation*}
$$

uniformly for any $\phi, \phi_{1}, \phi_{2} \in \mathcal{B}_{\ell}$. Let $f(u)=|u|^{\frac{4}{N-2}} u$ and set

$$
\begin{aligned}
N_{\ell}= & f\left(\sum_{j=1}^{\ell}(-1)^{j} P U_{j}+\sum_{j=1}^{\ell-1} \phi_{j, \varepsilon}+\phi\right)-f\left(\sum_{j=1}^{\ell}(-1)^{j} P U_{j}\right)-f^{\prime}\left(\sum_{j=1}^{\ell}(-1)^{j} P U_{j}\right) \phi \\
& -f\left(\sum_{j=1}^{\ell-1}\left[(-1)^{j} P U_{j}+\phi_{j, \varepsilon}\right]\right)+f\left(\sum_{j=1}^{\ell-1}(-1)^{j} P U_{j}\right) .
\end{aligned}
$$

First, by (5.8) for $\ell=1$ we have that

$$
\begin{aligned}
\left\|\mathcal{N}_{1}(\phi)\right\| & \leq c\left|N_{1}\right|_{\frac{2 N}{N+2}}=c\left|f\left(-P U_{1}+\phi\right)-f\left(-P U_{1}\right)-f^{\prime}\left(-P U_{1}\right) \phi\right|_{\frac{2 N}{N+2}} \\
& \leq c(|\phi|_{\frac{2 N}{N-2}}^{\frac{N+2}{N-2}}+\underbrace{\left|U_{1}^{\frac{6-N}{N-2}} \phi^{2}\right|_{\frac{2 N}{N+2}}^{N+2}}_{\text {if } 3 \leq N \leq 5})=o(\|\phi\|)
\end{aligned}
$$

and then the first in (5.34) is established. For $\ell \geq 2$, by (5.8) we have the expansion

$$
\begin{align*}
N_{\ell} & =f\left(\sum_{j=1}^{\ell}(-1)^{j} P U_{j}+\sum_{j=1}^{\ell-1} \phi_{j, \varepsilon}\right)-f\left(\sum_{j=1}^{\ell}(-1)^{j} P U_{j}\right)-f\left(\sum_{j=1}^{\ell-1}\left[(-1)^{j} P U_{j}+\phi_{j, \varepsilon}\right]\right) \\
& +f\left(\sum_{j=1}^{\ell-1}(-1)^{j} P U_{j}\right)+\left[f^{\prime}\left(\sum_{j=1}^{\ell}(-1)^{j} P U_{j}+\sum_{j=1}^{\ell-1} \phi_{j, \varepsilon}\right)-f^{\prime}\left(\sum_{j=1}^{\ell}(-1)^{j} P U_{j}\right)\right] \phi  \tag{5.35}\\
& +O\left(|\phi|^{\frac{N+2}{N-2}}\right)+\underbrace{O\left(\sum_{j=1}^{\ell}\left(P U_{j}\right)^{\frac{6-N}{N-2}} \phi^{2}+\sum_{j=1}^{\ell-1}\left|\phi_{j, \varepsilon}\right|^{\frac{6-N}{N-2}} \phi^{2}\right)}_{\text {if } 3 \leq N \leq 5}
\end{align*}
$$

Letting $\mathcal{A}_{h}$ be as in (5.7), we have that

$$
\begin{equation*}
\left\|\mathcal{N}_{\ell}(\phi)\right\| \leq c \sum_{h=0}^{\ell}\left|N_{\ell}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{h}} \tag{5.36}
\end{equation*}
$$

By (5.8) and

$$
|a+b|^{\frac{4}{N-2}}-|a|^{\frac{4}{N-2}}=O(|b|^{\frac{4}{N-2}}+\underbrace{|a|^{\frac{6-N}{N-2}}|b|}_{\text {if } 3 \leq N \leq 5}),
$$

for $h=0, \ldots, \ell-1$ we have

$$
\begin{align*}
\left|N_{\ell}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{h}} & \leq\left. c\left|U_{l}^{\frac{N+2}{N-2}}+U_{l} \sum_{j=1}^{\ell-1}\left[U_{j}^{\frac{4}{N-2}}+\left|\phi_{j, \varepsilon}\right|^{\frac{4}{N-2}}\right]+|\phi|_{j=1}^{\ell-1}\right| \phi_{j, \varepsilon}\right|^{\frac{4}{N-2}}+\left.|\phi|^{\frac{N+2}{N-2}}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{h}} \\
& +c \underbrace{\sum_{j=1}^{\ell} U_{j}^{\frac{6-N}{N-2}} \phi^{2}+\sum_{j=1}^{\ell-1}\left|\phi_{j, \varepsilon}\right|^{\frac{6-N}{N-2}} \phi^{2}+\left.\sum_{i=1}^{\ell} \sum_{j=1}^{\ell-1} U_{i}^{\frac{6-N}{N-2}}|\phi|\left|\phi_{j, \varepsilon}\right|\right|_{\frac{2 N}{N+2}, \mathcal{A}_{h}}}_{\text {if } 3 \leq N \leq 5}  \tag{5.37}\\
& =O\left(R_{\ell}+\left.\left.\sum_{j=1}^{\ell-1}| | \phi_{j, \varepsilon}\right|^{\frac{4}{N-2}} U_{l}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{h}}\right)+o(\|\phi\|)
\end{align*}
$$

and

$$
\begin{align*}
& \left|N_{\ell}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{\ell}} \leq\left. c\left|U_{l}^{\frac{4}{N-2}} \sum_{j=1}^{\ell-1}\right| \phi_{j, \varepsilon}\left|+\sum_{j=1}^{\ell-1}\right| \phi_{j, \varepsilon}\right|^{\frac{N+2}{N-2}}+\left.|\phi|^{\frac{N+2}{N-2}}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{\ell}} \\
& +c \underbrace{\left.\left.\left|U_{l} \sum_{i, j=1}^{\ell-1} U_{i}^{\frac{6-N}{N-2}}\right| \phi_{j, \varepsilon}\left|+\sum_{i=1}^{\ell} \sum_{j=1}^{\ell-1} U_{i}^{\frac{6-N}{N-2}} \phi_{j, \varepsilon}^{2}+\sum_{j=1}^{\ell} U_{j}^{\frac{6-N}{N-2}} \phi^{2}+\sum_{j=1}^{\ell-1}\right| \phi_{j, \varepsilon}\right|^{\frac{6-N}{N-2}} \phi^{2}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{\ell}}}_{\text {if } 3 \leq N \leq 5} \\
& =O\left(\sum_{j=1}^{\ell-1}\left|U_{\ell}^{\frac{4}{N-2}} \phi_{j, \varepsilon}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{\ell}}+\sum_{j=1}^{\ell-1}\left|\phi_{j, \varepsilon}\right|_{\frac{2 N}{N-2}, \mathcal{A}_{\ell}}^{\frac{N+2}{N-2}}+\sum_{j=1}^{\ell-1}\left|\phi_{j, \varepsilon}\right|_{\frac{2 N}{N-2}, \mathcal{A}_{\ell}}^{2}\right)  \tag{5.38}\\
& +\underbrace{O\left(\left.\sum_{i, j=1}^{\ell-1}\left|U_{\ell}^{\frac{4}{N-2}} \phi_{j, \varepsilon} \frac{\frac{N-2}{4}}{\frac{2 N}{N+2}, \mathcal{A}_{\ell}}\right| U_{i} \frac{\frac{6-N}{N-2}}{\frac{2 N}{N-2}, \mathcal{A}_{\ell}} \right\rvert\, \phi_{j, \varepsilon} \frac{\frac{6-N}{\frac{2 N}{N-2}}, \mathcal{A}_{\ell}}{\frac{1}{N}}\right)}_{\text {if } 3 \leq N \leq 5}+o(\|\phi\|)
\end{align*}
$$

for any $\phi \in \mathcal{B}_{\ell}$ in view of (5.10)-(5.12) and Hölder inequality, where $R_{\ell}$ is given in (5.33). Notice in the estimate (5.37) we couple the first/second term in the expression (5.35) of $N_{\ell}$ with the
third/fourth one, while in the estimate (5.38) the first two and the second two terms in (5.35) are coupled.

For $j=1, \ldots, \ell-1$ there holds $\mathcal{A}_{\ell} \subset B_{\rho \mu_{j}}(0)$ and by (4.8) we deduce that

$$
\begin{equation*}
\left|\phi_{j, \varepsilon}\right|_{\frac{2 N}{N-2}, \mathcal{A}_{\ell}} \leq \frac{c}{\mu_{j}^{\Gamma}}\left|\frac{1}{|x|^{\beta_{-}}}\right|_{\frac{2 N}{N-2}, \mathcal{A}_{\ell}} \leq c\left(\frac{\sqrt{\mu_{\ell-1} \mu_{\ell}}}{\mu_{j}}\right)^{\Gamma}=O\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\frac{\Gamma}{2}}\right) \tag{5.39}
\end{equation*}
$$

and

$$
\begin{align*}
& \left|U_{\ell}^{\frac{4}{N-2}} \phi_{j, \varepsilon}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{\ell}} \leq \frac{c}{\mu_{j}^{\Gamma}}\left|\frac{U_{\ell}^{\frac{4}{N-2}}}{|x|^{\beta-}}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{\ell}} \\
& \leq \begin{cases}c\left(\frac{\mu_{\ell}}{\mu_{j}}\right)^{\Gamma}\left|\frac{U^{\frac{4}{N-2}}}{|y|^{\beta}-}\right|_{\frac{2 N}{N+2}}, \frac{\mathcal{A}_{\ell}}{\mu_{\ell}}=O\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}\right) & \text { if } 3 \leq N \leq 5 \\
c\left(\frac{\mu_{\ell}}{\mu_{j}}\right)^{\Gamma}\left|\frac{U \frac{U^{-2}}{N-2}}{|y|^{\beta-}-}\right|_{\frac{2 N}{N+2}}, \frac{\mathcal{A}_{\ell}}{\mu_{\ell}}=O\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma} \log ^{\frac{2}{3}} \frac{1}{\mu_{\ell}}\right) & \text { if } N=6 \\
c \frac{\mu_{\ell}^{N-2}}{\mu_{j}^{\Gamma}}\left|\frac{1}{|x|^{\beta-+\frac{4}{N-2} \beta_{+}}}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{\ell}}=O\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\frac{N+2}{N-2} \frac{\Gamma}{2}}\right) & \text { if } N \geq 7 .\end{cases} \tag{5.40}
\end{align*}
$$

For $h=0, \ldots, \ell-2$ by (5.10) we deduce

$$
\begin{equation*}
\left|\left|\phi_{j, \varepsilon}\right|^{\frac{4}{N-2}} P U_{\ell}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{h}} \leq c\left\|\phi_{j, \varepsilon}\right\|^{\frac{4}{N-2}}\left|P U_{\ell}\right|_{\frac{2 N}{N-2}, \mathcal{A}_{h}} \leq c\left(\frac{\mu_{\ell}}{\sqrt{\mu_{h} \mu_{h+1}}}\right)^{\Gamma}=O\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}\right) \tag{5.41}
\end{equation*}
$$

for any $j=1, \ldots, \ell-1$. Splitting $\mathcal{A}_{\ell-1}$ as $\mathcal{A}_{\ell-1}^{\prime} \cup \mathcal{A}_{\ell-1}^{\prime \prime}$, where $\mathcal{A}_{\ell-1}^{\prime}=\mathcal{A}_{\ell-1} \cap B_{\rho \mu_{\ell-1}}(0)$ and $\mathcal{A}_{\ell-1}^{\prime \prime}=\mathcal{A}_{\ell-1} \backslash B_{\rho \mu_{\ell-1}}(0)$, by (4.8) and (5.10) we get that

$$
\begin{align*}
& \left|\left|\phi_{j, \varepsilon}\right|^{\frac{4}{N-2}} P U_{\ell}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{\ell-1}} \leq \frac{c}{\mu_{j}^{\frac{4 \Gamma}{N-2}}}\left|\frac{P U_{\ell}}{|x|^{\frac{4 \beta--}{N-2}}}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{\ell-1}^{\prime}}+c\left\|\phi_{j, \varepsilon}\right\|^{\frac{4}{N-2}}\left|P U_{\ell}\right|_{\frac{2 N}{N-2}, \mathcal{A}_{\ell-1}^{\prime \prime}} \\
& \leq \frac{c}{\mu_{j}^{\frac{4 \Gamma}{N-2}}\left|P U_{\ell}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{\ell-1}^{\prime}}\left\{\begin{array}{ll}
\mu_{\ell-1}^{\frac{4 \Gamma}{N-2}-2} & \text { if } \Gamma \geq \frac{N-2}{2} \\
\left(\mu_{\ell-1} \mu_{\ell}\right)^{\frac{2 \Gamma}{N-2}-1} & \text { if } \Gamma<\frac{N-2}{2}
\end{array}+c\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}\right.} \begin{array}{l}
=O\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\frac{N+2}{N-2} \frac{\Gamma}{2}}+\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\frac{\Gamma}{2}+1}\right)
\end{array} \tag{5.42}
\end{align*}
$$

in view of

$$
\left.\left.\begin{array}{l}
\left|P U_{\ell}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{\ell-1}^{\prime}} \leq \mu_{\ell}^{2}|U|_{\frac{2 N}{N+2}, \mathbb{R}^{N} \backslash B}^{\sqrt{\frac{\mu_{\ell-1}}{\mu_{\ell}}}}(0)  \tag{5.43}\\
\left.\left|P U_{\ell}\right|_{\frac{2 N}{N-2}, \mathcal{A}_{\ell-1}^{\prime \prime}} \leq|U|_{\frac{2 N}{N-2}, \mathbb{R}^{N} \backslash B_{\frac{\mu_{\ell-1}}{\mu_{\ell}}}(0)}=O\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\frac{\Gamma}{2}-1}\right) \\
\mu_{\ell-1}
\end{array}\right)^{\Gamma}\right) .
$$

Estimates (5.10), (5.39)-(5.40) into (5.38) and (5.41)-(5.42) into (5.37) lead to $\left|N_{\ell}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{h}}=$ $O\left(R_{\ell}\right)+o(\|\phi\|)$ for any $h=0, \ldots, \ell$, which, inserted into (5.36), finally give the validity of the first in (5.34) for $\ell \geq 2$.

Concerning the second one in (5.34), we have that

$$
\begin{aligned}
&\left\|\mathcal{N}_{\ell}\left(\phi_{1}\right)-\mathcal{N}_{\ell}\left(\phi_{2}\right)\right\| \leq c\left|\left[\sum_{j=1}^{\ell-1}\left|\phi_{j, \varepsilon}\right|^{\frac{4}{N-2}}+\left|\phi_{1}\right|^{\frac{4}{N-2}}+\left|\phi_{2}\right|^{\frac{4}{N-2}}\right]\left(\phi_{1}-\phi_{2}\right)\right|_{\frac{2 N}{N+2}} \\
&+c \underbrace{\left|\sum_{i=1}^{\ell} U_{i}^{\frac{6-N}{N-2}}\left[\sum_{j=1}^{\ell-1}\left|\phi_{j, \varepsilon}\right|+\left|\phi_{1}\right|+\left|\phi_{2}\right|\right]\left(\phi_{1}-\phi_{2}\right)\right|_{\frac{2 N}{N+2}}}_{\text {if } 3 \leq N \leq 5}
\end{aligned}
$$

in view of

$$
\begin{aligned}
& \left|a+b+c_{1}\right|^{\frac{4}{N-2}}\left(a+b+c_{1}\right)-\left|a+b+c_{2}\right|^{\frac{4}{N-2}}\left(a+b+c_{2}\right)-\frac{N+2}{N-2}|a|^{\frac{4}{N-2}}\left(c_{1}-c_{2}\right) \\
& =\left|c_{1}-c_{2}\right| O(|b|^{\frac{4}{N-2}}+\left|c_{1}\right|^{\frac{4}{N-2}}+\left|c_{2}\right|^{\frac{4}{N-2}}+\underbrace{|a|^{\frac{6-N}{N-2}}\left(|b|+\left|c_{1}\right|+\left|c_{2}\right|\right)}_{\text {if } 3 \leq N \leq 5})
\end{aligned}
$$

for all $a, b, c_{1}, c_{2} \in \mathbb{R}$. Therefore there holds

$$
\begin{align*}
\left\|\mathcal{N}_{\ell}\left(\phi_{1}\right)-\mathcal{N}_{\ell}\left(\phi_{2}\right)\right\| & \leq c\left[\sum_{j=1}^{\ell-1}\left\|\phi_{j, \varepsilon}\right\|^{\frac{4}{N-2}}+\left\|\phi_{1}\right\|^{\frac{4}{N-2}}+\left\|\phi_{2}\right\|^{\frac{4}{N-2}}\right]\left\|\phi_{1}-\phi_{2}\right\| \\
& +\underbrace{c \sum_{i=1}^{\ell}\left|U_{i}\right|_{\frac{2 N}{N-2}}^{\frac{6-N}{N-2}}\left[\sum_{j=1}^{\ell-1}\left\|\phi_{j, \varepsilon}\right\|+\left\|\phi_{1}\right\|+\left\|\phi_{2}\right\|\right]\left\|\phi_{1}-\phi_{2}\right\|}_{\text {if } 3 \leq N \leq 5}  \tag{5.44}\\
& =o(1)\left\|\phi_{1}-\phi_{2}\right\| .
\end{align*}
$$

in view of $\phi_{1}, \phi_{2} \in \mathcal{B}_{\ell}$. The validity of (5.34) has been fully established.
To prove the validity of (4.8), assume that either $\ell=1$ or $\ell \geq 2$ and $C^{1}-\operatorname{maps}\left(d_{1}, \ldots, d_{k}\right) \in A \rightarrow$ $\phi_{j, \varepsilon}\left(d_{1}, \ldots, d_{j}\right) \in \mathcal{K}_{j}^{\perp}$ have already been constructed for $j=1, \ldots, \ell-1$ satisfying the properties of Proposition 4.3. Setting $u_{j}=(-1)^{j} P U_{j}+\phi_{j, \varepsilon}, j=1, \ldots, \ell$, we have that $u_{j}$ satisfies

$$
\begin{equation*}
u_{j}=\mathrm{s}^{*}\left[f\left(\sum_{i=1}^{j} u_{i}\right)-f\left(\sum_{i=1}^{j-1} u_{i}\right)+\varepsilon u_{j}\right]+\Psi_{j}, \quad \Psi_{j} \in \mathcal{K}_{j}, \tag{5.45}
\end{equation*}
$$

for any $j=1, \ldots, \ell$, and then

$$
\begin{equation*}
\sum_{j=1}^{\ell} u_{j}=1^{*}\left[f\left(\sum_{i=1}^{\ell} u_{i}\right)+\varepsilon \sum_{j=1}^{\ell} u_{j}\right]+\sum_{j=1}^{\ell} \lambda_{j, \varepsilon} P Z_{j} \tag{5.46}
\end{equation*}
$$

in view of $\sum_{j=1}^{\ell} \Psi_{j} \in \mathcal{K}_{\ell}$. We claim that $\lambda_{j, \varepsilon}=o(1)$ as $\varepsilon \rightarrow 0$ for any $j=1, \ldots, \ell$. Indeed, let us take the inner product of (5.46) against $P Z_{i}, i=1, \ldots, \ell$, to get

$$
\begin{align*}
\sum_{j=1}^{\ell} \lambda_{j, \varepsilon}\left\langle P Z_{j}, P Z_{i}\right\rangle & =\int_{\Omega}\left[\sum_{j=1}^{\ell}(-1)^{j} U_{j}^{\frac{N+2}{N-2}}-f\left(\sum_{j=1}^{\ell} u_{j}\right)\right] P Z_{i} d x+\sum_{j=1}^{i-1}\left\langle\phi_{j, \varepsilon}, P Z_{i}\right\rangle \\
& -\varepsilon \sum_{j=1}^{\ell} \int_{\Omega} u_{j} P Z_{i} d x \tag{5.47}
\end{align*}
$$

in view of $\phi_{j, \varepsilon} \in \mathcal{K}_{i}^{\perp}$ for any $j \geq i$ and $P U_{j}=1^{*}\left(U_{j}^{\frac{N+2}{N-2}}\right)$. By Proposition 3.6 and (5.22) we have that

$$
\begin{align*}
\int_{\Omega}\left(P Z_{i}\right)^{\frac{2 N}{N-2}} d x & =\int_{\Omega} Z_{i}^{\frac{2 N}{N-2}} d x+O\left(\mu_{i}^{\Gamma} \int_{\Omega} \frac{Z_{i}^{\frac{N+2}{N-2}}}{|x|^{\beta_{-}}} d x+\int_{\Omega} \frac{\mu_{i}^{\frac{2 N}{N-2} \Gamma}}{|x|^{\frac{2 N}{N-2} \beta_{-}}} d x\right)  \tag{5.48}\\
& =\int_{\frac{\Omega}{\mu_{i}}} Z^{\frac{2 N}{N-2}} d y+O\left(\mu_{i}^{2 \Gamma} \int_{\frac{\Omega}{\mu_{i}}} \frac{Z^{\frac{N+2}{N-2}}}{|y|^{\beta_{-}}} d y\right)+o(1)=\int_{\mathbb{R}^{N}} Z^{\frac{2 N}{N-2}} d y+o(1)
\end{align*}
$$

and

$$
\begin{align*}
\left\langle P Z_{j}, P Z_{i}\right\rangle & =\frac{N+2}{N-2} \int_{\Omega} U_{j}^{\frac{4}{N^{-2}}} Z_{j} P Z_{i} d x \\
& =\frac{N+2}{N-2} \int_{\Omega} U_{j}^{\frac{4}{N-2}} Z_{j} Z_{i} d x+O\left(\mu_{i}^{\Gamma} \int_{\Omega} \frac{U_{j}^{\frac{4}{N-2}} Z_{j}}{|x|^{\beta_{-}}} d x\right)  \tag{5.49}\\
& =\frac{N+2}{N-2} \delta_{i j} \int_{\frac{\Omega}{\mu_{j}}} U^{\frac{4}{N-2}} Z^{2} d y+O\left(\mu_{i}^{\Gamma} \mu_{j}^{\Gamma} \int_{\frac{\Omega}{\mu_{j}}} \frac{U^{\frac{4}{N-2}} Z}{|y|^{\beta_{-}}} d y\right)+o(1) \\
& =\frac{N+2}{N-2} \delta_{i j} \int_{\mathbb{R}^{N}} U^{\frac{4}{N-2}} Z^{2} d y+o(1)
\end{align*}
$$

in view of $P Z_{j}=1^{*}\left(\frac{N+2}{N-2} U_{j}^{\frac{4}{N-2}} Z_{j}\right),\left|Z_{i}\right| \leq U_{i}$ and

$$
\left|\int_{\Omega} U_{j}^{\frac{4}{N-2}} Z_{j} Z_{i} d x\right| \leq c \int_{\Omega} U_{j}^{\frac{N+2}{N-2}} U_{i} d x \leq \begin{cases}c\left(\frac{\mu_{j}}{\mu_{i}}\right)^{\Gamma} \int_{\mathbb{R}^{N}} \frac{U^{\frac{N+2}{N-2}}}{|y|^{\beta-2}} d y & \text { if } j>i \\ c\left(\frac{\mu_{i}}{\mu_{j}}\right)^{\Gamma} \int_{\mathbb{R}^{N}} \frac{U^{\frac{N+2}{N-2}}}{|y|^{\beta+}} d y & \text { if } j<i\end{cases}
$$

By inserting (5.48)-(5.49) into (5.47) we get that

$$
\begin{align*}
\frac{N+2}{N-2}\left(\int_{\mathbb{R}^{N}} U^{\frac{4}{N-2}} Z^{2} d y\right) \lambda_{i, \varepsilon} & =\int_{\Omega}\left[\sum_{j=1}^{\ell}(-1)^{j}\left(P U_{j}\right)^{\frac{N+2}{N-2}}-f\left(\sum_{j=1}^{\ell}(-1)^{j} P U_{j}\right)\right] P Z_{i} d x \\
& +o\left(\sum_{j=1}^{\ell}\left|\lambda_{j, \varepsilon}\right|\right)+o(1) \tag{5.50}
\end{align*}
$$

in view of (4.6), (5.3)-(5.5), (5.8) and $\left\|P U_{j}\right\|=O(1)$. We have that

$$
\begin{aligned}
& \int_{\Omega}\left[\sum_{j=1}^{\ell}(-1)^{j}\left(P U_{j}\right)^{\frac{N+2}{N-2}}-f\left(\sum_{j=1}^{\ell}(-1)^{j} P U_{j}\right)\right] P Z_{i} d x \\
& =-\sum_{j=1}^{\ell} \int_{\Omega}\left[f\left(\sum_{i=1}^{j}(-1)^{i} P U_{i}\right)-f\left(\sum_{i=1}^{j-1}(-1)^{i} P U_{i}\right)-(-1)^{j}\left(P U_{j}\right)^{\frac{N+2}{N-2}}\right] P Z_{i} d x \\
& =O\left(\sum_{h=0}^{\ell}\left|f\left(\sum_{i=1}^{j}(-1)^{i} P U_{i}\right)-f\left(\sum_{i=1}^{j-1}(-1)^{i} P U_{i}\right)-(-1)^{j}\left(P U_{j}\right)^{\frac{N+2}{N-2}}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{h}}\right)
\end{aligned}
$$

in view of (5.48), with $\mathcal{A}_{h}$ given as in (5.7). By (5.9)-(5.14) we deduce that

$$
\int_{\Omega}\left[\sum_{j=1}^{\ell}(-1)^{j}\left(P U_{j}\right)^{\frac{N+2}{N-2}}-f\left(\sum_{j=1}^{\ell}(-1)^{j} P U_{j}\right)\right] P Z_{i} d x=o(1)
$$

and then (5.50) reduces to

$$
\frac{N+2}{N-2}\left(\int_{\mathbb{R}^{N}} U^{\frac{4}{N-2}} Z^{2} d y\right) \lambda_{i, \varepsilon}=o\left(\sum_{j=1}^{\ell}\left|\lambda_{j, \varepsilon}\right|\right)+o(1)
$$

This in turn implies that $\sum_{j=1}^{\ell}\left|\lambda_{j, \varepsilon}\right|=o(1)$, and the claim is established.

The function $\mathcal{U}_{\ell}(y)=\mu_{\ell}^{\frac{N-2}{2}}\left(\sum_{j=1}^{\ell} u_{j}\right)\left(\mu_{\ell} y\right)$ solves

$$
\begin{equation*}
-\Delta \mathcal{U}_{\ell}-\frac{\gamma}{|y|^{2}} \mathcal{U}_{\ell}-\varepsilon \mu_{\ell}^{2} \mathcal{U}_{\ell}-\mathcal{U}_{\ell}^{\frac{N+2}{N-2}}=h \quad \text { in } \frac{\Omega}{\mu_{\ell}} \tag{5.51}
\end{equation*}
$$

in view of (5.46), where

$$
h=O\left(\sum_{j=1}^{\ell}\left|\lambda_{j, \varepsilon}\right|\left(\frac{\mu_{\ell}}{\mu_{j}}\right)^{\frac{N+2}{2}} U^{\frac{N+2}{N-2}}\left(\frac{\mu_{\ell}}{\mu_{j}} y\right)\right)
$$

We have that

$$
|y|^{\tau}|h(y)|=O\left(\sum_{j=1}^{\ell}\left|\lambda_{j, \varepsilon}\right|\left(\frac{\mu_{\ell}}{\mu_{j}}\right)^{\frac{N+2}{N-2} \Gamma}\right)=O(1)
$$

with $\tau=\frac{N+2}{N-2} \beta_{-}<\beta_{-}+2$ and

$$
\left(\int_{B_{r}(0)}\left|\mathcal{U}_{\ell}\right|^{\frac{2 N}{N-2}} d y\right)^{\frac{N-2}{2 N}} \leq \ell\left(\int_{B_{r}(0)} U^{\frac{2 N}{N-2}} d y\right)^{\frac{N-2}{2 N}}+\sum_{j=1}^{\ell}\left\|\phi_{j, \epsilon}\right\|^{\frac{2 N}{N-2}} \leq \epsilon
$$

in view of $B_{r \mu_{\ell}} \subset B_{r \mu_{j}}$ for any $j=1, \ldots, \ell-1$ and (4.6), for some $r=r(\epsilon)$. We are in position to apply Proposition 5.1 below to get the existence of $\rho, K>0$ such that

$$
|y|^{\beta-\left|\mathcal{U}_{\ell}(x)\right| \leq K}
$$

for all $x \in B_{\rho}(0)$, or equivalently

$$
|x|^{\beta_{-}}\left|\sum_{j=1}^{\ell} u_{j}(x)\right| \leq \frac{K}{\mu_{\ell}^{\Gamma}} \quad \text { in } B_{\rho \mu_{\ell}}(0)
$$

Since by assumption for any $j=1, \ldots, \ell-1$

$$
\left|u_{j}\right| \leq P U_{j}+\left|\phi_{j, \varepsilon}\right| \leq \frac{C}{\mu_{j}^{\Gamma}|x|^{\beta_{-}}} \leq \frac{C}{\mu_{\ell}^{\Gamma}|x|^{\beta_{-}}}
$$

in $B_{\rho \mu_{j}}(0)$ with $B_{\rho \mu_{\ell}}(0) \subset B_{\rho \mu_{j}}(0)$, we deduce that $\left|u_{\ell}\right| \leq \frac{C}{\mu_{\ell}^{\Gamma}|x|^{\beta}-}$ and then $\left|\phi_{\ell, \varepsilon}\right| \leq \frac{C}{\mu_{\ell}^{\Gamma}|x|^{\beta}-}$ in $B_{\rho \mu_{\ell}}(0)$, and (4.8) is established.
The following result is established using the same scheme as in [20] and for convenience we reproduce it here.

Proposition 5.1. Let $M>0$ and $\tau<\beta_{-}+2$. There exist $\varepsilon, \rho, K>0$ so that

$$
\begin{equation*}
\sup _{x \in B_{\rho}(0)}|x|^{\beta_{-}}|u(x)| \leq K \tag{5.52}
\end{equation*}
$$

does hold for any solution $u$ of

$$
\begin{equation*}
-\Delta u-\frac{\gamma}{|x|^{2}} u=a u+|u|^{\frac{4}{N-2}} u+h \text { in } B_{1}(0), \quad u \in H^{1}\left(B_{1}(0)\right) \tag{5.53}
\end{equation*}
$$

with

$$
\begin{align*}
& |u|_{\frac{2 N}{N-2}, B_{1}(0)} \leq \varepsilon  \tag{5.54}\\
& |a|_{\infty, B_{1}(0)}+\sup _{x \in B_{1}(0)}|x|^{\tau}|h(x)| \leq M . \tag{5.55}
\end{align*}
$$

Proof. We need some preliminary facts.
$1^{\text {st }}$ Claim: Let $M>0$ and $q>2$ with $\frac{4(q-1)}{q^{2}}>\frac{4 \gamma}{(N-2)^{2}}$. There exist $\epsilon, K>0$ so that for any $0<\rho_{2}<\rho_{1} \leq 1$ there holds

$$
\begin{equation*}
|u|_{B_{\rho_{2}}(0), \frac{N q}{N-2}} \leq K\left[|u|_{B_{\rho_{1}}(0), q}+|h(x)|_{B_{\rho_{1}}(0), \frac{N q}{N-2+2 q}}\right] \tag{5.56}
\end{equation*}
$$

for any solution $u \in L^{q}\left(B_{\rho_{1}}(0)\right)$ of (5.53) so that (5.54), $h^{\frac{N}{N-2+2 q}} \in L^{q}\left(B_{\rho_{1}}(0)\right)$ and $|a|_{\infty, B_{\rho_{1}}(0)} \leq M$ do hold.

Indeed, given $L>0$ define

$$
G_{L}(t)= \begin{cases}|t|^{q-2} t & \text { if }|t| \leq L \\ (q-1) L^{q-2} t-(q-2) L^{q-1} \operatorname{sign} t & \text { if }|t|>L\end{cases}
$$

and

$$
H_{L}(t)= \begin{cases}|t|^{\frac{q}{2}} & \text { if }|t| \leq L \\ \frac{q}{2} L^{\frac{q-2}{2}}|t|-\frac{q-2}{2} L^{\frac{q}{2}} & \text { if }|t|>L\end{cases}
$$

in such a way that $H_{L}, G_{L} \in C^{1}(\mathbb{R})$ satisfy

$$
\begin{equation*}
G_{L}^{\prime}(t)=\frac{4(q-1)}{q^{2}}\left[H_{L}^{\prime}(t)\right]^{2}, \quad t \in \mathbb{R} \tag{5.57}
\end{equation*}
$$

Observe that for all $t \in \mathbb{R}$ there hold

$$
\begin{equation*}
0 \leq t G_{L}(t) \leq H_{L}^{2}(t), \quad\left|G_{L}(t)\right| \leq H_{L}^{\frac{2(q-1)}{q}}(t) \tag{5.58}
\end{equation*}
$$

Given $0<\rho_{2}<\rho_{1} \leq 1$, let $\eta \in C_{c}^{\infty}\left(\mathbb{R}^{N}\right)$ be so that $\eta=1$ in $B_{\rho_{2}}(0)$ and $\eta=0$ in $\mathbb{R}^{N} \backslash B_{\rho_{1}}(0)$. Test (5.53) against $\eta^{2} G_{L}(u)$ to get

$$
\begin{align*}
& \int_{B_{1}(0)}\left\langle\nabla u, \nabla\left(\eta^{2} G_{L}(u)\right)\right\rangle d x-\int_{B_{1}(0)} \frac{\gamma}{|x|^{2}} \eta^{2} u G_{L}(u) d x \\
& =\lambda \int_{B_{1}(0)} \eta^{2} u G_{L}(u) d x+\int_{B_{1}(0)} \eta^{2}|u|^{\frac{4}{N-2}} u G_{L}(u) d x+\int_{B_{1}(0)} \eta^{2} h(x) G_{L}(u) d x \tag{5.59}
\end{align*}
$$

By (5.57) an integration by parts leads to

$$
\begin{align*}
& \int_{B_{1}(0)}\left\langle\nabla u, \nabla\left(\eta^{2} G_{L}(u)\right)\right\rangle d x=\frac{4(q-1)}{q^{2}} \int_{B_{1}(0)}\left|\nabla\left(\eta H_{L}(u)\right)\right|^{2} \\
& +\frac{4(q-1)}{q^{2}} \int_{B_{1}(0)} \eta \Delta \eta H_{L}^{2}(u) d x-\int_{B_{1}(0)} \Delta\left(\eta^{2}\right) J_{L}(u) d x \tag{5.60}
\end{align*}
$$

where $J_{L}(t)=\int_{0}^{t} G_{L}(\tau) d \tau$. Inserting (5.60) into (5.59) we get

$$
\begin{align*}
& \frac{4 \alpha}{(\alpha+1)^{2}} \int_{B_{1}(0)}\left|\nabla\left(\eta H_{L}(u)\right)\right|^{2} d x-\int_{B_{1}(0)} \frac{\gamma}{|x|^{2}} \eta^{2} u G_{L}(u) d x \\
& \leq K \int_{B_{\rho_{1}(0)}}\left[H_{L}^{2}(u)+J_{L}(u)\right] d x+K \int_{B_{1}(0)}\left\{|u|^{\frac{4}{N-2}}\left[\eta H_{L}(u)\right]^{2}+\eta^{2}|h(x)|\left|G_{L}(u)\right|\right\} d x \tag{5.61}
\end{align*}
$$

in view of (5.58), where $K$ denotes a generic constant just depending on $q, M, \gamma, N$ and $\rho_{1}, \rho_{2}$. By Hölder and Sobolev inequalities we have that

$$
\begin{align*}
\int_{B_{1}(0)}|u|^{\frac{4}{N-2}}\left[\eta H_{L}(u)\right]^{2} d x & \leq\left(\int_{B_{1}(0)}|u|^{\frac{2 N}{N-2}} d x\right)^{\frac{2}{N}}\left(\int_{B_{1}(0)}\left|\eta H_{L}(u)\right|^{\frac{2 N}{N-2}} d x\right)^{\frac{N-2}{N}}  \tag{5.62}\\
& \leq K \varepsilon^{\frac{4}{N-2}} \int_{B_{1}(0)}\left|\nabla\left(\eta H_{L}(u)\right)\right|^{2} d x
\end{align*}
$$

in view of (5.54) and

$$
\begin{align*}
& \int_{B_{1}(0)} \eta^{2}|h(x)|\left|G_{L}(u)\right| d x \leq \int_{B_{1}(0)}|h(x)|\left[\eta H_{L}(u)\right]^{\frac{2(q-1)}{q}} d x \\
& \leq K\left(\int_{B_{1}(0)}|h(x)|^{\frac{N q}{N-2+2 q}} d x\right)^{\frac{N-2+2 q}{N q}}\left(\int_{B_{1}(0)}\left|\nabla\left(\eta H_{L}(u)\right)\right|^{2} d x\right)^{\frac{q-1}{q}} \tag{5.63}
\end{align*}
$$

in view of (5.58). Plugging (5.62)-(5.63) into (5.61) by (5.58) we get

$$
\begin{aligned}
& {\left[\frac{4(q-1)}{q^{2}}-K \epsilon^{\frac{4}{N-2}}\right] \int_{B_{1}(0)}\left|\nabla\left(\eta H_{L}(u)\right)\right|^{2} d x-\gamma^{+} \int_{B_{1}(0)} \frac{1}{|x|^{2}}\left[\eta H_{L}(u)\right]^{2} d x} \\
& \leq K \int_{B_{\rho_{1}(0)}}\left[H_{L}^{2}(u)+J_{L}(u)\right] d x+K\left(\int_{B_{1}(0)}|h(x)|^{\frac{N q}{N-2+2 q}} d x\right)^{\frac{N-2+2 q}{N q}}\left(\int_{B_{1}(0)}\left|\nabla\left(\eta H_{L}(u)\right)\right|^{2} d x\right)^{\frac{q-1}{q}}
\end{aligned}
$$

where $\gamma^{+}=\max \{\gamma, 0\}$. By the Hardy inequality we finally deduce that

$$
\begin{align*}
& {\left[\frac{4(q-1)}{q^{2}}-K \varepsilon^{\frac{4}{N-2}}-\frac{4 \gamma^{+}}{(N-2)^{2}}\right] \int_{B_{1}(0)}\left|\nabla\left(\eta H_{L}(u)\right)\right|^{2} d x \leq K \int_{B_{\rho_{1}(0)}}\left[H_{L}^{2}(u)+J_{L}(u)\right] d x} \\
& +K\left(\int_{B_{1}(0)}|h(x)|^{\frac{N q}{N-2+2 q}} d x\right)^{\frac{N-2+2 q}{N q}}\left(\int_{B_{1}(0)}\left|\nabla\left(\eta H_{L}(u)\right)\right|^{2} d x\right)^{\frac{q-1}{q}} \tag{5.64}
\end{align*} .
$$

Since $\frac{4(q-1)}{q^{2}}>\frac{4 \gamma}{(N-2)^{2}}$, for $\epsilon$ small we can assume that $\frac{4(q-1)}{q^{2}}-K \varepsilon^{\frac{4}{N-2}}-\frac{4 \gamma+}{(N-2)^{2}}>0$. By (5.64) we deduce that

$$
\begin{align*}
& \left(\int_{B_{1}(0)}\left|\eta H_{L}(u)\right|^{\frac{2 N}{N-2}} d x\right)^{\frac{N-2}{N}} \leq K \int_{B_{1}(0)}\left|\nabla\left(\eta H_{L}(u)\right)\right|^{2} d x  \tag{5.65}\\
& \leq K \int_{B_{\rho_{1}(0)}}\left[H_{L}^{2}(u)+J_{L}(u)\right] d x+K\left(\int_{B_{1}(0)}|h(x)|^{\frac{N q}{N-2+2 q}} d x\right)^{\frac{N-2+2 q}{N}}
\end{align*}
$$

in view of $\frac{q-1}{q}<1$ and the Sobolev inequality. Since $0 \leq J_{L}(t) \leq t G_{L}(t) \leq H_{L}^{2}(t) \leq|t|^{q}$ does hold for all $t \in \mathbb{R}$ in view of (5.58), by (5.65) we get that

$$
\left(\int_{B_{\rho_{2}}(0)}\left|H_{L}(u)\right|^{\frac{2 N}{N-2}} d x\right)^{\frac{N-2}{N}} \leq K \int_{B_{\rho_{1}}(0)}|u|^{q} d x+K\left(\int_{B_{\rho_{1}(0)}}|h(x)|^{\frac{N q}{N-2+2 q}} d x\right)^{\frac{N-2+2 q}{N}}
$$

Taking the power $\frac{1}{q}$ and letting $L \rightarrow+\infty$ by the Fatou's Lemma we obtain the validity of (5.56).
$\underline{2}^{\text {nd }}$ Claim: Let $1 \leq q<Q, M>0$ and $\tau<\beta_{-}+2$, where

$$
Q= \begin{cases}+\infty & \text { if } \gamma \leq 0 \\ \frac{N}{\beta_{-}} & \text {if } \gamma>0\end{cases}
$$

There exist $\epsilon, K>0$ so that

$$
\begin{equation*}
|u|_{q, B_{\frac{1}{2}}(0)} \leq K\left[|u|_{\frac{2 N}{N-2}, B_{1}(0)}+1\right] \tag{5.66}
\end{equation*}
$$

does hold for any solution $u$ of (5.53) so that (5.54)-(5.55) are valid.
Indeed, notice that for $\gamma>0$ the property $\frac{4(q-1)}{q^{2}}>\frac{4 \gamma}{(N-2)^{2}}, q>2$, is equivalent to $2<q<\frac{N-2}{\beta_{-}}=$ $\frac{N-2}{N} Q$. Since

$$
\sup _{q \in\left[1, \frac{N-2}{N} Q\right)} \frac{N q}{N-2+2 q}=\left\{\begin{array}{ll}
\frac{N}{2} & \text { if } \gamma \leq 0 \\
\frac{N}{\beta-+2} & \text { if } \gamma>0
\end{array}<\frac{N}{\tau}\right.
$$

if $\tau<\beta_{-}+2$, we have that

$$
\begin{equation*}
|h|_{\frac{N q}{N-2+2 q}, B_{1}(0)} \leq K(M, \tau) \tag{5.67}
\end{equation*}
$$

for any $q \in\left[1, \frac{N-2}{N} Q\right), \tau<\tau_{0}$ and $h$ satisfying (5.55). Let $q_{j}=\left(\frac{N-2}{N}\right)^{j} q, j \in \mathbb{N}$, and $r_{j}$ be any decreasing sequence so that $r_{0}=1$ and $r_{k}=\frac{1}{2}$. Since $q_{j} \rightarrow 0$ as $j \rightarrow+\infty$, we can find a smallest index $k \in \mathbb{N}$ so that $q_{k} \leq \frac{2 N}{N-2}$. Notice that $q_{j} \leq q_{1}<\frac{N-2}{N} Q$ for all $j \geq 1$ and $q_{k}>2$ in view of $q_{k-1}>\frac{2 N}{N-2}$. We can apply the $1^{\text {st }}$ Claim with $q_{j}$ between $r_{j+1}$ and $r_{j}$ for $j=1, \ldots, k-1$ and obtain by (5.67) that for $\epsilon>0$ small

$$
\begin{equation*}
|u|_{q, B_{\frac{1}{2}}(0)} \leq K\left[|u|_{q_{k}, B_{1}(0)}+1\right] \tag{5.68}
\end{equation*}
$$

does hold for some $K>0$. We can conclude in view of $q_{k} \leq \frac{2 N}{N-2}$ and

$$
|u|_{q_{k}, B_{1}(0)} \leq \omega_{N}^{\frac{2 N-(N-2) q_{k}}{2 N q_{k}}}|u|_{\frac{2 N}{N-2}, B_{1}(0)}
$$

$\underline{3^{\text {rd }} \text { Claim: }}$ Let $\frac{2 N}{N-2}<q<Q, M>0$ and $\tau<\beta_{-}+2$. There exist $\epsilon, K>0$ so that

$$
\begin{equation*}
\sup _{x \in B_{\frac{1}{4}}(0)}|x|^{\frac{N}{q}}|u(x)| \leq K \tag{5.69}
\end{equation*}
$$

does hold for any solution $u$ of (5.53) so that (5.54)-(5.55) are valid.
Given $\frac{2 N}{N-2}<q<Q, M>0$ and $\tau<\beta_{-}+2$, choose $\epsilon>0$ small so that the $2^{\text {nd }}$ Claim applies. The function $U(y)=|x|^{\frac{N}{q}} u(|x| y)$ satisfies

$$
-\Delta U-\frac{\gamma}{|y|^{2}} U=|x|^{2} a(|x| y) U+|x|^{2-\frac{4 N}{q(N-2)}}|U|^{\frac{4}{N-2}} U+|x|^{\frac{N}{q}+2} h(|x| y) \quad \text { in } B_{2}(0) \backslash B_{\frac{1}{2}}(0)
$$

where

$$
\begin{equation*}
\left.\left.\left||x|^{2} a(|x| y) U+|x|^{2-\frac{4 N}{q(N-2)}}\right| U\right|^{\frac{4}{N-2}} U\left|\leq \frac{M}{16}\right| U\left|+4^{\frac{4 N}{q(N-2)}-2}\right| U\right|^{\frac{N+2}{N-2}} \tag{5.70}
\end{equation*}
$$

and

$$
\begin{equation*}
|x|^{\frac{N}{q}+2}|h(|x| y)| \leq|x|^{\frac{N}{q}+2-\tau} \frac{M}{|y|^{\tau}} \leq 4^{2 \tau-\frac{N}{q}-2} M \tag{5.71}
\end{equation*}
$$

for any $|x| \leq \frac{1}{4}$ and $\frac{1}{2} \leq|y| \leq 2$, in view of $\frac{N}{q}+2-\tau>\frac{N}{Q}+2-\tau \geq \beta_{-}+2-\tau>0$. Since

$$
|U|_{q, B_{2}(0) \backslash B_{1}(0)} \leq|u|_{q, B_{\frac{1}{2}}(0)}
$$

by (5.70)-(5.71) standard elliptic estimates apply for any $\tilde{q} \geq q>\frac{2 N}{N-2}$ and through a bootstrap argument yield the validity of (5.69) for some universal constant $K>0$.
To conclude the proof, let us rewrite (5.53) as

$$
\begin{equation*}
-\Delta u-\frac{\gamma+\tilde{a}(x)}{|x|^{2}} u=h(x), \quad \tilde{a}(x)=|x|^{2} a(x)+|x|^{2}|u(x)|^{\frac{4}{N-2}} . \tag{5.72}
\end{equation*}
$$

Since $\frac{4 N}{Q(N-2)}<2$, by $3^{\text {rd }}$ Claim and (5.55) it follows that there exists $C_{0}, \theta>0$ such that

$$
\begin{equation*}
|\tilde{a}(x)| \leq C_{0}|x|^{\theta} \tag{5.73}
\end{equation*}
$$

for any $|x| \leq \frac{1}{4}$. Since $\tau<\beta_{-}+2$, we can fix $\alpha$ so that $\beta_{-}-\theta<\alpha<\beta_{-}$and $\alpha>\tau-2$. Then we can find $\rho>0$ small so that $\Phi(x)=|x|^{-\beta_{-}-}|x|^{-\alpha} \geq \frac{1}{2}|x|^{-\beta_{-}}$in $B_{\rho}(0)$ and satisfies

$$
-\Delta \Phi-\frac{\gamma+\tilde{a}}{|x|^{2}} \Phi=\frac{\alpha^{2}-\alpha(N-2)+\gamma}{|x|^{\alpha+2}}-\frac{\tilde{a}}{|x|^{2}} \Phi \geq \frac{\alpha^{2}-\alpha(N-2)+\gamma}{|x|^{2+\alpha}}-\frac{C_{0}}{|x|^{\beta-+2-\theta}} \geq \frac{M}{|x|^{\tau}}
$$

in $B_{\rho}(0)$ in view of $\alpha^{2}-\alpha(N-2)+\gamma>0$. Since $|u(x)| \leq K \Phi(x)$ for some $K \geq 1$ and any $x \in \partial B_{\rho}(0)$ in view of (5.69), by (5.55) we can use $K \Phi$ as a supersolution of (5.72) with $h$ and $-h$ to get by the maximum principle $|u(x)| \leq K \Phi(x) \leq K|x|^{-\beta_{-}}$for any $x \in B_{\rho}(0)$, as desired.
5.4. The reduced energy: end of the proof for Proposition 4.4. Let us first show that $\widetilde{J}_{\varepsilon}$ has the same expansion as $J_{\varepsilon}$. Setting $u_{\ell}=(-1)^{\ell} P U_{\ell}+\phi_{\ell, \varepsilon}, \ell=1, \ldots, k$, we have that

$$
\begin{align*}
\widetilde{J}_{\varepsilon}\left(\mu_{1}, \ldots, \mu_{k}\right) & =J_{\varepsilon}\left(\mu_{1}, \ldots, \mu_{k}\right)+\sum_{\ell, i=1}^{k}\left[\left\langle u_{\ell}, \phi_{i, \varepsilon}\right\rangle-\varepsilon \int_{\Omega} u_{\ell} \phi_{i, \varepsilon} d x\right]-\frac{1}{2}\left\|\sum_{\ell=1}^{k} \phi_{\ell, \varepsilon}\right\|^{2}  \tag{5.74}\\
& +\frac{\varepsilon}{2}\left|\sum_{\ell=1}^{k} \phi_{\ell, \varepsilon}\right|_{2}-\frac{N-2}{2 N} \int_{\Omega}\left[\left|\sum_{\ell=1}^{k} u_{\ell}\right|^{\frac{2 N}{N-2}}-\left|\sum_{\ell=1}^{k}(-1)^{\ell} P U_{\ell}\right|^{\frac{2 N}{N-2}}\right] d x
\end{align*}
$$

in view $\langle u+v, u+v\rangle=\langle u, u\rangle-\langle v, v\rangle+2\langle u+v, v\rangle$ for any bi-linear form $\langle\cdot, \cdot\rangle$. By multiplying (5.45) against $\phi_{i, \varepsilon} \in \mathcal{K}_{\ell}^{\perp}, i \geq \ell$, we get that

$$
\left\langle u_{\ell}, \phi_{i, \varepsilon}\right\rangle-\varepsilon \int_{\Omega} u_{\ell} \phi_{i, \varepsilon} d x=\int_{\Omega}\left[f\left(\sum_{j=1}^{\ell} u_{j}\right)-f\left(\sum_{j=1}^{\ell-1} u_{j}\right)\right] \phi_{i, \varepsilon} d x
$$

for any $i \geq \ell$. Therefore, (5.74) reads as

$$
\begin{align*}
\widetilde{J}_{\varepsilon}\left(\mu_{1}, \ldots, \mu_{k}\right)= & J_{\varepsilon}\left(\mu_{1}, \ldots, \mu_{k}\right)+\sum_{i<\ell}(-1)^{\ell}\left[\left\langle P U_{\ell}, \phi_{i, \varepsilon}\right\rangle-\varepsilon \int_{\Omega} P U_{\ell} \phi_{i, \varepsilon} d x\right] \\
& -\frac{1}{2} \sum_{\ell=1}^{k}\left\|\phi_{\ell, \varepsilon}\right\|^{2}+\frac{\varepsilon}{2} \sum_{\ell=1}^{k}\left|\phi_{\ell, \varepsilon}\right|_{2}^{2}+\sum_{i \geq \ell} \int_{\Omega}\left[f\left(\sum_{j=1}^{\ell} u_{j}\right)-f\left(\sum_{j=1}^{\ell-1} u_{j}\right)\right] \phi_{i, \varepsilon} d x  \tag{5.75}\\
& -\frac{N-2}{2 N} \int_{\Omega}\left[\left|\sum_{\ell=1}^{k} u_{\ell}\right|^{\frac{2 N}{N-2}}-\left|\sum_{\ell=1}^{k}(-1)^{\ell} P U_{\ell}\right|^{\frac{2 N}{N-2}}\right] d x .
\end{align*}
$$

Setting

$$
\begin{aligned}
\widetilde{\Upsilon}_{\ell} & =(-1)^{\ell}\left(\left\langle P U_{\ell}, \sum_{i=1}^{\ell-1} \phi_{i, \varepsilon}\right\rangle-\varepsilon \int_{\Omega} P U_{\ell}\left(\sum_{i=1}^{\ell-1} \phi_{i, \varepsilon}\right)\right)-\frac{1}{2}\left\|\phi_{\ell, \varepsilon}\right\|^{2}+\frac{\varepsilon}{2}\left|\phi_{\ell, \varepsilon}\right|_{2}^{2}+\int_{\Omega} f\left(\sum_{j=1}^{\ell} u_{j}\right) \phi_{\ell, \varepsilon} d x \\
& -\frac{N-2}{2 N} \int_{\Omega}\left[\left|\sum_{j=1}^{\ell} u_{j}\right|^{\frac{2 N}{N-2}}-\left|\sum_{j=1}^{\ell-1} u_{j}\right|^{\frac{2 N}{N-2}}-\left|\sum_{j=1}^{\ell}(-1)^{j} P U_{j}\right|^{\frac{2 N}{N-2}}+\left|\sum_{j=1}^{\ell-1}(-1)^{j} P U_{j}\right|^{\frac{2 N}{N-2}}\right],
\end{aligned}
$$

by (5.75) we have that

$$
\widetilde{J}_{\varepsilon}\left(\mu_{1}, \ldots, \mu_{k}\right)=J_{\varepsilon}\left(\mu_{1}, \ldots, \mu_{k}\right)+\sum_{\ell=1}^{k} \widetilde{\Upsilon}_{\ell}
$$

in view of

$$
\sum_{i \geq \ell} \int_{\Omega}\left[f\left(\sum_{j=1}^{\ell} u_{j}\right)-f\left(\sum_{j=1}^{\ell-1} u_{j}\right)\right] \phi_{i, \varepsilon} d x=\sum_{i=1}^{k} \int_{\Omega} f\left(\sum_{j=1}^{i} u_{j}\right) \phi_{i, \varepsilon} d x
$$

Since for $\ell \geq 2$

$$
\begin{aligned}
& (-1)^{\ell}\left(\left\langle P U_{\ell}, \sum_{i=1}^{\ell-1} \phi_{i, \varepsilon}\right\rangle-\varepsilon \int_{\Omega} P U_{\ell}\left(\sum_{i=1}^{\ell-1} \phi_{i, \varepsilon}\right)\right) \\
& =(-1)^{\ell} \int_{\Omega} P U_{\ell}^{\frac{N+2}{N-2}}\left(\sum_{i=1}^{\ell-1} \phi_{i, \varepsilon}\right) d x+O\left(\left|U_{\ell}^{\frac{N+2}{N-2}}-\left(P U_{\ell}\right)^{\frac{N+2}{N-2}}\right|_{\frac{2 N}{N+2}}+\varepsilon\left|P U_{\ell}\right|_{\frac{2 N}{N+2}}\right) \sum_{i=1}^{\ell-1}\left\|\phi_{i, \varepsilon}\right\| \\
& =(-1)^{\ell} \int_{\Omega} P U_{\ell}^{\frac{N+2}{N-2}}\left(\sum_{i=1}^{\ell-1} \phi_{i, \varepsilon}\right) d x+o\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}+\varepsilon \mu_{\ell}^{2}\right)
\end{aligned}
$$

in view of (4.6) and (5.2)-(5.5) with $\mu_{1}$ replaced by $\mu_{\ell}$, we have that

$$
\begin{equation*}
\widetilde{\Upsilon}_{1}=-\frac{N-2}{2 N} \int_{\Omega} \widetilde{v}_{1} d x+O\left(\left\|\mathcal{E}_{1}\right\|^{2}\right), \quad \widetilde{\Upsilon}_{\ell}=-\frac{N-2}{2 N} \int_{\Omega} \widetilde{v}_{\ell} d x+o\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}+\varepsilon \mu_{\ell}^{2}\right) \tag{5.76}
\end{equation*}
$$

for any $\ell=2, \ldots, k$, where

$$
\begin{aligned}
\widetilde{v}_{\ell}= & \left|\sum_{j=1}^{\ell} u_{j}\right|^{\frac{2 N}{N-2}}-\left|\sum_{j=1}^{\ell-1} u_{j}\right|^{\frac{2 N}{N-2}}-\left|\sum_{j=1}^{\ell}(-1)^{j} P U_{j}\right|^{\frac{2 N}{N-2}}+\left|\sum_{j=1}^{\ell-1}(-1)^{j} P U_{j}\right|^{\frac{2 N}{N-2}} \\
& -\frac{2 N}{N-2}\left[f\left(\sum_{j=1}^{\ell} u_{j}\right) \phi_{\ell, \varepsilon}+(-1)^{\ell}\left(P U_{\ell}\right)^{\frac{N+2}{N-2}}\left(\sum_{i=1}^{\ell-1} \phi_{i, \varepsilon}\right)\right]
\end{aligned}
$$

By (5.8) and (5.22) we have the expansion

$$
\begin{align*}
\widetilde{v}_{\ell} & =\left|\sum_{j=1}^{\ell}(-1)^{j} P U_{j}+\sum_{j=1}^{\ell-1} \phi_{j, \varepsilon}\right|^{\frac{2 N}{N-2}}-\left|\sum_{j=1}^{\ell-1} u_{j}\right|^{\frac{2 N}{N-2}}-\left|\sum_{j=1}^{\ell}(-1)^{j} P U_{j}\right|^{\frac{2 N}{N-2}} \\
& +\left|\sum_{j=1}^{\ell-1}(-1)^{j} P U_{j}\right|^{\frac{2 N}{N-2}}-\frac{2 N}{N-2}(-1)^{\ell}\left(P U_{\ell}\right)^{\frac{N+2}{N-2}}\left(\sum_{i=1}^{\ell-1} \phi_{i, \varepsilon}\right)  \tag{5.77}\\
& +O\left(\left|\phi_{\ell, \varepsilon}\right|^{\frac{2 N}{N-2}}+\sum_{j=1}^{\ell}\left(P U_{j}\right)^{\frac{4}{N-2}} \phi_{\ell, \varepsilon}^{2}+\sum_{j=1}^{\ell-1}\left|\phi_{j, \varepsilon}\right|^{\frac{4}{N-2}} \phi_{\ell, \varepsilon}^{2}\right)
\end{align*}
$$

We have that

$$
\begin{equation*}
\widetilde{\Upsilon}_{1}=O\left(\left\|\mathcal{E}_{1}\right\|^{2}\right)=o\left(\mu_{1}^{2 \Gamma}\right) \tag{5.78}
\end{equation*}
$$

in view of (3.10)-(3.13) and (5.76).
Let us now discuss the case $\ell \geq 2$. Given $\mathcal{A}_{h}$ as in (5.7), by (5.8) and (5.22) for $h=0, \ldots, \ell-1$ we have

$$
\begin{align*}
\left|\widetilde{v}_{\ell}\right|_{1, \mathcal{A}_{h}} & \leq c\left|U_{l}^{\frac{2 N}{N-2}}+U_{l}^{2} \sum_{j=1}^{\ell-1}\left[U_{j}^{\frac{4}{N-2}}+\left|\phi_{j, \varepsilon}\right|^{\frac{4}{N-2}}\right]+U_{\ell}^{\frac{N+2}{N-2}} \sum_{j=1}^{\ell-1}\right| \phi_{j, \varepsilon}| |_{1, \mathcal{A}_{h}} \\
& +c\left|\left[f\left(\sum_{j=1}^{\ell-1} u_{j}\right)-f\left(\sum_{j=1}^{\ell-1}(-1)^{j} P U_{j}\right)\right] U_{\ell}\right|_{1, \mathcal{A}_{h}}+O\left(\left\|\phi_{\ell, \varepsilon}\right\|^{2}\right)  \tag{5.79}\\
& \leq\left.\left. c \sum_{j=1}^{\ell-1}\left|U_{\ell}\right| \phi_{j, \varepsilon}\right|^{\frac{N+2}{N-2}}\right|_{1, \mathcal{A}_{h}}+\sum_{i, j=1}^{\ell-1}\left|U_{\ell} U_{i}^{\frac{4-2}{N-2}}\right| \phi_{j, \varepsilon}| |_{1, \mathcal{A}_{h}}+o\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}+\varepsilon \mu_{\ell}^{2}\right)
\end{align*}
$$

and

$$
\begin{align*}
\left|\widetilde{v}_{\ell}\right|_{1, \mathcal{A}_{\ell}} & \leq\left. c\left|\sum_{i=1}^{\ell} \sum_{j=1}^{\ell-1} U_{i}^{\frac{4}{N-2}} \phi_{j, \varepsilon}^{2}+\sum_{j=1}^{\ell-1}\right| \phi_{j, \varepsilon}\right|^{\frac{2 N}{N-2}}+\left.\sum_{i, j=1}^{\ell-1} U_{i}^{\frac{N+2}{N-2}}\left|\phi_{j, \varepsilon}\right|\right|_{1, \mathcal{A}_{\ell}} \\
& +c\left|\left[f\left(\sum_{j=1}^{\ell}(-1)^{j} P U_{j}\right)-f\left((-1)^{\ell} P U_{\ell}\right)\right] \sum_{j=1}^{\ell-1} \phi_{j, \varepsilon}\right|_{1, \mathcal{A}_{\ell}}+O\left(\left\|\phi_{\ell, \varepsilon}\right\|^{2}\right)  \tag{5.80}\\
& \leq\left.\left. c\left|U_{\ell}^{\frac{4}{N-2}} \sum_{j=1}^{\ell-1} \phi_{j, \varepsilon}^{2}+\sum_{j=1}^{\ell-1}\right| \phi_{j, \varepsilon}\right|^{\frac{2 N}{N-2}}\right|_{1, \mathcal{A}_{\ell}}+o\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}+\varepsilon \mu_{\ell}^{2}\right)
\end{align*}
$$

in view of (4.6), (5.10)-(5.14) and for any $i, j=1, \ldots, \ell-1$

$$
\begin{aligned}
& \left|U_{l}^{2} U_{j}^{\frac{4}{N-2}}\right|_{1, \mathcal{A}_{h}}=O\left(\left|U_{j}^{\frac{4}{N-2}} U_{\ell}\right|_{\frac{2 N}{N+2}, \mathcal{A}_{h}}\left|U_{\ell}\right|_{\frac{2 N}{N-2}, \mathcal{A}_{h}}\right), U_{\ell}^{2}\left|\phi_{j, \varepsilon}\right|^{\frac{4}{N-2}}+U_{\ell}^{\frac{N+2}{N-2}}\left|\phi_{j, \varepsilon}\right|=O\left(U_{\ell}\left|\phi_{j, \varepsilon}\right|^{\frac{N+2}{N-2}}+U_{\ell}^{\frac{2 N}{N-2}}\right), \\
& U_{i}^{\frac{4}{N-2}} \phi_{j, \varepsilon}^{2}+U_{i}^{\frac{N+2}{N-2}}\left|\phi_{j, \varepsilon}\right|=O\left(\left|\phi_{j, \varepsilon}\right|^{\frac{2 N}{N-2}}+U_{i}^{\frac{2 N}{N-2}}\right), U_{\ell}^{\frac{4}{N-2}} U_{i} \phi_{j, \varepsilon}=O\left(\left[U_{\ell}^{\frac{4}{N-2}} U_{i}\right]^{\frac{2 N}{N+2}}+\left|\phi_{j, \varepsilon}\right|^{\frac{2 N}{N-2}}\right)
\end{aligned}
$$

Notice in the estimate (5.79) we couple the first two and the second two terms in the expression (5.77) of $\widetilde{v}_{\ell}$, while in the estimate (5.80) the first/second term is coupled with the third/fourth one in (5.77).
For $j=1, \ldots, \ell-1$ there holds $\mathcal{A}_{\ell} \subset B_{\rho \mu_{j}}(0)$ and by (4.8) we deduce that

$$
\begin{align*}
& \left|U_{\ell}^{\frac{4}{N-2}} \phi_{j, \varepsilon}^{2}+\left|\phi_{j, \varepsilon}\right|^{\frac{2 N}{N-2}}\right|_{1, \mathcal{A}_{\ell}} \leq \frac{c}{\mu_{j}^{2 \Gamma}} \int_{\mathcal{A}_{\ell}} \frac{U_{\ell}^{\frac{4}{N-2}}}{|x|^{2 \beta_{-}}} d x+\frac{c}{\mu_{j}^{\frac{2 N}{N-2} \Gamma}} \int_{\mathcal{A}_{\ell}} \frac{d x}{|x|^{\frac{2 N}{N-2} \beta_{-}}}  \tag{5.81}\\
& \leq c\left(\frac{\mu_{\ell}}{\mu_{j}}\right)^{2 \Gamma} \int_{\frac{\mathcal{A}_{\ell}}{\mu_{\ell}}} \frac{U^{\frac{4}{N-2}}}{|y|^{2 \beta_{-}}} d y+c\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\frac{N}{N-2} \Gamma}=O\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\frac{N}{N-2} \Gamma} \log \frac{1}{\mu_{\ell}}\right) .
\end{align*}
$$

For $h=0, \ldots, \ell-2$ by (4.6) and (5.10) we deduce

$$
\begin{align*}
\|\left.\left.\phi_{j, \varepsilon}\right|^{\frac{N+2}{N-2}} U_{\ell}\right|_{1, \mathcal{A}_{h}}+\left|U_{\ell} U_{i}^{\frac{4}{N-2}} \phi_{j, \varepsilon}\right|_{1, \mathcal{A}_{h}} & \leq c\left\|\phi_{j, \varepsilon}\right\|^{\frac{N+2}{N-2}}\left|U_{\ell}\right|_{\frac{2 N}{N-2}, \mathcal{A}_{h}}+c\left\|\phi_{j, \varepsilon}\right\|\left|U_{\ell}\right|_{\frac{2 N}{N-2}, \mathcal{A}_{h}} \\
& =o\left(\left(\frac{\mu_{\ell}}{\sqrt{\mu_{h} \mu_{h+1}}}\right)^{\Gamma}\right)=o\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}\right) \tag{5.82}
\end{align*}
$$

for any $i, j=1, \ldots, \ell-1$. Splitting $\mathcal{A}_{\ell-1}$ as $\mathcal{A}_{\ell-1}^{\prime} \cup \mathcal{A}_{\ell-1}^{\prime \prime}$, where $\mathcal{A}_{\ell-1}^{\prime}=\mathcal{A}_{\ell-1} \cap B_{\rho \mu_{\ell-1}}(0)$ and $\mathcal{A}_{\ell-1}^{\prime \prime}=\mathcal{A}_{\ell-1} \backslash B_{\rho \mu_{\ell-1}}(0)$, by (4.6) and (4.8) we get that

$$
\begin{align*}
& \|\left.\left.\phi_{j, \varepsilon}\right|^{\frac{N+2}{N-2}} U_{\ell}\right|_{1, \mathcal{A}_{\ell-1}}+\left|U_{\ell} U_{i}^{\frac{4}{N-2}} \phi_{j, \varepsilon}\right|_{1, \mathcal{A}_{\ell-1}} \\
& \leq c\left\|\phi_{j, \varepsilon}\right\|^{\frac{2 N}{(N-2)(N-1)}}\left|\phi_{j, \varepsilon}^{\frac{N+1}{N-1}} U_{\ell}\right|_{\frac{N-1}{N-2}, \mathcal{A}_{\ell-1}^{\prime}}+c\left\|\phi_{j, \varepsilon}\right\|^{\frac{2 N}{(N-2)(5 N-9)}}\left|U_{\ell} U_{i}^{\frac{4}{N-2}} \phi_{j, \varepsilon}^{\frac{5 N^{2}-21 N+18}{(N-2)(5 N-9)}}\right|_{\frac{5 N-9}{5 N-10}, \mathcal{A}_{\ell-1}^{\prime}} \\
& +c\left[\left\|\phi_{j, \varepsilon}\right\|^{\frac{N+2}{N-2}}+\left\|\phi_{j, \varepsilon}\right\|\right]\left|U_{\ell}\right|_{\frac{2 N}{N-2}, \mathcal{A}_{\ell-1}^{\prime \prime}} \\
& =o\left[\frac{\mu_{\ell}^{\Gamma}}{\mu_{j}^{N+1} \Gamma}\left(\int_{\mathcal{A}_{\ell-1}^{\prime}} \frac{d x}{|x|^{N-\frac{2 \Gamma}{N-2}}}\right)^{\frac{N-2}{N-1}}+\frac{\mu_{\ell}^{\Gamma}}{\mu_{i}^{\frac{4 \Gamma}{N-2}} \mu_{j}^{\frac{5 N^{2}-21 N+18}{(N-2)(5 N-9)} \Gamma}}\left(\int_{\mathcal{A}_{\ell-1}^{\prime}} \frac{d x}{|x|^{N-\frac{18 \Gamma}{5(N-2)}}}\right)^{\frac{5 N-10}{5 N-9}}\right] \\
& +o\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}\right)=o\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}\right) \tag{5.83}
\end{align*}
$$

for any $i, j=1, \ldots, \ell-1$ in view of (5.43). Inserting (5.82)-(5.83) into (5.79) and (5.81) into (5.80) we deduce that $\left|\widetilde{v}_{\ell}\right|_{1, \mathcal{A}_{h}}=o\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}+\varepsilon \mu_{\ell}^{2}\right)$ for any $h=0, \ldots, \ell$ and then

$$
\begin{equation*}
\widetilde{\Upsilon}_{\ell}=o\left(\left(\frac{\mu_{\ell}}{\mu_{\ell-1}}\right)^{\Gamma}\right) \tag{5.84}
\end{equation*}
$$

for any $\ell \geq 2$ in view of (3.10)-(3.13) and (5.76). Thanks to (5.78) and (5.84) we have established that $\widetilde{\Upsilon}_{\ell}$ satisfies the same estimate as $\Upsilon_{\ell}, \ell=1, \ldots, k$.
To conclude the proof of Proposition 4.4, let us show that, if $\left(d_{1}, \ldots, d_{k}\right)$ is a critical point of $\widetilde{J}_{\varepsilon}$, then $\sum_{\ell=1}^{k}(-1)^{\ell} P U_{\ell}+\Phi_{\varepsilon}$ is a critical point of the functional $J_{\varepsilon}$. Assume that

$$
0=\partial_{d_{h}} \widetilde{J}_{\varepsilon}\left(d_{1}, \ldots, d_{k}\right)=\nabla J_{\varepsilon}\left(\sum_{\ell=1}^{k}(-1)^{\ell} P U_{\ell}+\Phi_{\varepsilon}\right)\left[(-1)^{h} \partial_{d_{h}} P U_{h}+\partial_{d_{h}} \Phi_{\varepsilon}\right]
$$

for any $h=1, \ldots, k$. Since

$$
\nabla J_{\varepsilon}\left(\sum_{\ell=1}^{k}(-1)^{\ell} P U_{\ell}+\Phi_{\varepsilon}\right)=\sum_{j=1}^{k} \lambda_{j, \varepsilon} P Z_{j}
$$

we get that

$$
\begin{equation*}
0=\sum_{j=1}^{k} \lambda_{j, \varepsilon}\left\langle P Z_{j},(-1)^{h} \partial_{d_{h}} P U_{h}+\partial_{d_{h}} \Phi_{\varepsilon}\right\rangle \tag{5.85}
\end{equation*}
$$

for any $h=1, \ldots, k$. Since by (5.49) there hold

$$
\left\|P Z_{h}\right\|^{2}=c_{0}+o(1), \quad\left\langle P Z_{j}, P Z_{h}\right\rangle=o(1) \forall j \neq h
$$

we have that

$$
\left\langle P Z_{j}, \partial_{d_{h}} \Phi_{\varepsilon}\right\rangle=\sum_{\ell=h}^{k}\left\langle P Z_{j}, \partial_{d_{h}} \phi_{\ell, \varepsilon}\right\rangle=O\left(\sum_{\ell=h}^{k}\left\|P Z_{j}\right\|\left\|\partial_{d_{h}} \phi_{\ell, \varepsilon}\right\|\right)=o(1)
$$

in view of (4.7). Since

$$
\partial_{d_{h}} P U_{h}=-\Gamma \alpha_{N} P Z_{h} \times\left\{\begin{array}{cl}
-\frac{1}{\varepsilon} & \text { if } \Gamma=1 \\
\frac{1}{d_{h}} & \text { if } \Gamma>1
\end{array}\right.
$$

by (5.85) we deduce that $\lambda_{j, \varepsilon}=0$ for any $j=1, \ldots, k$, or equivalently

$$
\nabla J_{\varepsilon}\left(\sum_{\ell=1}^{k}(-1)^{\ell} P U_{\ell}+\Phi_{\varepsilon}\right)=0
$$

Then $\sum_{\ell=1}^{k}(-1)^{\ell} P U_{\ell}+\Phi_{\varepsilon}$ is a critical point of the functional $J_{\varepsilon}$ and the proof of Proposition 4.4 is complete.
