SPECTRAL PROPERTIES OF INTEGRAL OPERATORS IN PROBLEMS OF INTERFACE DYNAMICS

ENZA ORLANDI

Abstract. We consider a family of integral operators which appears when analyzing layered equilibria and front dynamics of a phase kinetics equation with a conservation law. We study the spectra of these operators in $L^2$ and derive a lower bound for the associated quadratic forms in terms of the $H^{-1}$ norm.

1. Introduction

The purpose of this paper is to derive spectral estimates for a family of integral operators which appear when analyzing layered equilibria and front dynamics of a phase kinetics equation with a conservation law. We start by recalling some background.

Consider in the torus $T^d$ the nonlocal and nonlinear evolution equation

$$\frac{\partial}{\partial t} m(x, t) = \nabla \cdot \left( \nabla m(x, t) - \beta (1 - m(x, t)^2)(J \ast \nabla m)(x, t) \right)$$

where $\beta > 1$, $\ast$ denotes convolution and $J$ is a smooth, spherically symmetric probability density with compact support. This equation first appeared in the literature in a paper [13] on the dynamics of Ising systems with a long–range interaction and so–called “Kawasaki” or “exchange” dynamics and later it was rigorously derived in [10]. In this physical context, $m(x, t) \in [-1, 1]$ is the magnetization density at $x$ at time $t$, viewed on the length scale of the interaction, and $\beta$ is the inverse temperature. This introduction is not the place to fully explain the physical origins of the equation (1.1), and familiarity with them is not needed to understand our results or their proofs. We refer to the previous quoted paper for more physical insight. The equation (1.1) can be written in a gradient flow form. To do this, we introduce the free energy functional $F(m)$:

$$F(m) = \int_{T^d} [V(m(x)) - V(m_\beta)] dx + \frac{1}{4} \int_{T^d} \int_{T^d} J(x-y)[m(x) - m(y)]^2 dy dx,$$

where $V(m)$ is

$$V(m) = \frac{1}{2} m^2 + \frac{1}{\beta} \left[ \left( \frac{1 + m}{2} \right) \ln \left( \frac{1 + m}{2} \right) + \left( \frac{1 - m}{2} \right) \ln \left( \frac{1 - m}{2} \right) \right].$$

For $\beta > 1$, this potential function $V$ is a symmetric double well potential on $[-1, 1]$. We denote the positive minimizer of $V$ on $[-1, 1]$ by $m_\beta$. It is easy to see that $m_\beta$ is the positive solution of the equation

$$m_\beta = \tanh(\beta m_\beta).$$

Then equation (1.1) can be written as

$$\frac{\partial}{\partial t} m = \nabla \cdot \left( \sigma(m) \nabla \left( \delta F / \delta m \right) \right)$$

E.O. supported by Università di ROMA TRE.
where the mobility $\sigma(m)$ is given by

$$\sigma(m) = \beta(1 - m^2).$$

Formally one derives

$$\frac{d}{dt} F(m(t)) = -\int \left| \nabla \left( \frac{\delta F}{\delta m} \right) \right|^2 \sigma(m(t)) dx$$

thus $F$ is a Lyapunov function for (1.1). This suggests that the free energy should want to tend locally to one of the two minimizing values, $\pm m_\beta$, and that the interface between a region of $+m_\beta$ magnetization and a region of $-m_\beta$ magnetization should have a “profile” – in the direction orthogonal to the interface – that makes the transition from one local equilibrium to the other in a way that minimizes the free energy. This is indeed the case, as it has been shown in [3], [4] in dimension $d = 1$ and in [6] in dimension $d \leq 3$. Also clearly, the minimizers of the free energy $\pm m_\beta$ represent the “pure phases” of the system. However, unless the initial data $m_0$ happens to satisfy $\int_T m_0(x) dx = \pm m_\beta |T|$, these “pure phases” cannot be reached because of the conservation law. Instead, what will eventually be produced is a region in which $m(x) \approx \pm m_\beta$, with $m(x) \approx -m_\beta$ in its complement, and with a smooth transition across its boundary. This is referred to a phase segregation, and the boundary is the interface between the two phases. If we “stand far enough back” from $T$, all we see is the interface, and we do not see any structure across the interface – the structure now being on an invisibly small scale. The evolution of $m$ under the (1.1), or another evolution equation of this type, drives an evolution of the interface. To see any evolution of the interface, one must wait a long time. More specifically, let $\lambda$ be a small parameter, and introduce new variables $\tau$ and $\xi$ through

$$\tau = \lambda^3 t \quad \text{and} \quad \xi = \lambda x.$$

Then of course

$$\frac{\partial}{\partial t} = \lambda^3 \frac{\partial}{\partial \tau} \quad \text{and} \quad \frac{\partial}{\partial x} = \lambda \frac{\partial}{\partial \xi}.$$

Hence if $m(x, t)$ is a solution of (1.1), and we define $m^\lambda(\xi, \tau)$ by $m^\lambda(\xi, \tau) = m(x(\xi), t(\tau))$, we obtain

$$\frac{\partial}{\partial \tau} m^\lambda(\xi, \tau) = \frac{1}{\lambda} \nabla \cdot \left( \sigma(m^\lambda) \nabla \left[ \frac{1}{\beta} \arctanh m^\lambda - (J^\lambda \ast m^\lambda) \right] \right)(\xi, \tau)$$

where we denoted $J^\lambda(\xi) = \lambda^{-d} J(\lambda^{-1} \xi)$. One should just bear in mind that now we are looking at the evolution over a very long time scale when $\lambda$ is small.

One might hope that for small values of $\lambda$, all information about the evolution on $m^\lambda$ is contained in the evolution of the interface $\Gamma$. This is indeed the case. The sharp interface limit of equations typified by (1.8) has been investigated by Giacomin and Lebowitz, see [11], where it is heuristically proven that the limit motion is driven by the Mullins–Sekerka flow. They applied asymptotic analysis in the same spirit of the heuristic work of Pego [15] who derived the sharp interfaces limit for the Cahn-Hilliard equation.

The heuristic analysis of Pego has been rigorously proven for the Cahn-Hilliard equation by [1] in the 1994 and later on, applying a different method, in [5]. In both the papers the proof is based on two steps. The first step is to construct approximate solutions to the Cahn-Hilliard equation, which are, in the limit, close to the the Mullins–Sekerka flow. The second step is to show that the family of approximate solutions is indeed suitably close to the solution of the Cahn-Hilliard equation. To show this second step spectral estimates are needed. These were proven in [2], in dimensions $d = 2$, and [7] in any dimensions.

In [1] the family of the approximate solutions to Cahn-Hilliard equations are constructed by matched asymptotic expansions. In [5], the approximate solutions are constructed by an alternative method. The method based on the Hilbert expansion used in kinetic theory besides its relative simplicity, it leads to calculable higher order corrections to the interface motion. More important in this context is that the above approach allows to construct approximate solutions to the non local evolution equation (1.8).
Hence, to prove rigorously the heuristic analysis done by Giacomin and Lebowitz in [11], one might first construct approximate solutions and this can be done applying the same method as in [5]. Then one needs to derive spectral estimates to show that the constructed approximate solutions are close in some convenient norm to the solution of (1.8). In this paper we prove such spectral estimates. We set the problem in a bounded domain \( \Omega \subset \mathbb{R}^2 \). The restriction at dimension \( d = 2 \) is purely technical. In \( d = 2 \) we still can use global set of coordinates to represent the operator when close to the interface, \( \Gamma \). Namely in such a case any simple, smooth, closed, one dimensional curve can be mapped into a one dimensional circle. This allows to use Fourier series by going to the universal cover. In dimension \( d \geq 3 \) this would not be possible and one needs to deal with local coordinates and, possibly, Fourier transforms. Indeed, we believe that the result holds in any dimension and we leave this problem to further investigation.

We consider a family \( m^\lambda_1 \) of smooth functions which as \( \lambda \to 0 \) approach a step function with values \( \pm m_\beta \) which is discontinuous along a smooth curve \( \Gamma \subset \Omega \). This family consists of approximate solutions to (1.8), which can be constructed as in [5]. The functions \( m^\lambda_1 \) have a very specific behaviour in the direction orthogonal to \( \Gamma \), as \( \lambda \to 0 \). The specific form of \( m^\lambda_1 \) is given in (2.9). To simplify notations from now on we drop the index \( \lambda \). The linear equation obtaining linearising (1.8) at \( m_A \), is \(^1\)

\[
\frac{\partial}{\partial \tau} v(\xi, \tau) = \frac{1}{\lambda} \nabla \cdot \left( \sigma(m_A) \nabla \left[ \frac{v}{\sigma(m_A)} - (J^\lambda \ast_\Omega v) \right] \right)(\xi, \tau), \quad \xi \in \Omega, \tag{1.9}
\]

where \((J^\lambda \ast_\Omega v)(\xi) = \int_\Omega J^\lambda(\xi - \xi')v(\xi')d\xi' \), \( v = m^\lambda - m_A \) and we assume that \( v(\xi, 0) = 0 \), \( \xi \in \Omega \). By the conservation law, \( \int_\Omega d\xi v(\xi, \tau) = 0 \) for all \( \tau \geq 0 \). To simplify the explanation let us first pretend that \( \sigma(m_A) = 1 \) in \( \nabla \cdot \sigma(m_A) \nabla \). Let us then denote

\[
\frac{1}{\lambda} (A^\lambda_{m_A} v)(\xi) = \frac{1}{\lambda} \left\{ \frac{v(\xi)}{\sigma(m_A(\xi))} - (J^\lambda \ast_\Omega v)(\xi) \right\}, \quad \xi \in \Omega. \tag{1.10}
\]

Accordingly, to lower bound the spectrum of the linear operator on the right hand side of (1.9) in \( H^{-1}(\Omega) \) it suffices to show that

\[
\frac{1}{\lambda} \langle v, A^\lambda_{m_A} v \rangle \geq -C\|v\|^2_{H^{-1}(\Omega)}, \tag{1.11}
\]

where \( \langle v, g \rangle = \int_\Omega v(\xi)g(\xi)d\xi \) and \( C > 0 \) does not depend on \( \lambda \). In the general case, when \( \sigma(m_A) \neq 1 \), one can argue in the same manner by using a weighted \( H^{-1} \) norm, the weigh being \( \sigma(m_A) \). Because \( 0 < a \leq \sigma(m_A) \leq \beta \) the weighted \( H^{-1} \) norm is equivalent to the \( H^{-1} \). So we will prove (1.11), with \( v \in H^{-1}(\Omega) \).

As in Alikakos and Fusco, [2], or in X. Chen, [7], we first prove a lower bound of the spectrum of the operator in (1.10) in the \( L^2 \) norm, see Theorem 2.4, i.e

\[
\langle v, A^\lambda_{m_A} v \rangle \geq -C\lambda^2 \|v\|^2_{L^2(\Omega)}. \tag{1.12}
\]

Then, when

\[
\langle v, A^\lambda_{m_A} v \rangle \leq 0 \tag{1.13}
\]

we show that

\[
\lambda\|v\|^2_{L^2(\Omega)} \leq \|v\|^2_{H^{-1}(\Omega)} \tag{1.14}
\]

see Theorem 2.5. In this way we prove the lower bound (1.11).

---

\(^1\)We are now considering (1.8) in \( \Omega \subset \mathbb{R}^2 \) with non flux boundary conditions and with the convolution operator “restricted” in \( \Omega \).
1.1. Sketch of the proof. The proof of (1.11) presents some similarities with the one given in [2] and in [7] for the Cahn-Hilliard (C-H) case. Nevertheless, the implementation of each single step requires different technique due to the non locality of the operator. In particular, we cannot follow the method in [2] and in [7], as we cannot split the integral kernel in (1.10) into a tangential and in normal part, whereas expressions like $|\nabla v|^2$ split in such a way naturally.

Now we sommarize how we proceed in proving (1.11). We consider a neighborhood of $\Gamma$, $\mathcal{N}(\Gamma)$. We map the curve $\Gamma$ in a circle $T$ having perimeter equal to the length of the curve $L$ and each point $\xi \in \mathcal{N}(\Gamma)$ is mapped to $(s, r) \in T = T \times [-d_0, d_0]$ in a diffeomorphic way. We denote by $\alpha(s, r)$ the Jacobian of the map. We take a subset $\mathcal{N}_1(\Gamma) \subset \mathcal{N}(\Gamma)$ and we assume that

$$\inf_{\xi \in \Omega, \mathcal{N}_1(\Gamma)} \frac{1}{\sigma(m_A(\xi))} > C^* > 1.$$  \hfill (1.15)

To take advantage of (1.15) we split the quadratic form (1.12) in two integrals: one over $\mathcal{N}_1(\Gamma)$ the other in $\Omega \setminus \mathcal{N}_1(\Gamma)$. To this end we introduce the indicator function of the set $\mathcal{N}_1(\Gamma)$, $\eta_1(\xi) = 1$ when $\xi \in \mathcal{N}_1(\Gamma)$, $\eta_1(\xi) = 0$ in $\Omega \setminus \mathcal{N}_1(\Gamma)$ and $\eta_2(\xi) = 1 - \eta_1(\xi)$. Because of the non locality of the operator, taking into account that $\eta_2(\xi)\eta_1(\xi) = 0$ for $\xi \in \Omega$ and the symmetry of $J^\lambda(\cdot)$ we obtain that

$$\int_\Omega (A^\lambda_{m, A}(\xi) v(\xi)) d\xi = \int_\Omega (A^\lambda_{m, A} \eta_1(\xi) \eta_1(\xi) v(\xi)) d\xi$$

$$+ \int_\Omega (A^\lambda_{m, A} \eta_2(\xi) \eta_2(\xi) v(\xi)) d\xi$$

$$- 2 \int_\Omega d\xi \eta_1(\xi) v(\xi) (J^\lambda \ast \eta_2 v)(\xi).$$

Condition (1.15) implies

$$\int_\Omega (A^\lambda_{m, A} \eta_2 v)(\xi) \eta_2(\xi) v(\xi) d\xi \geq (C^* - 1) \|\eta_2 v\|^2_{L^2(\Omega)} > 0.$$  \hfill (1.16)

Even if we show that

$$\int_\Omega (A^\lambda_{m, A} \eta_1 v)(\xi) \eta_1 v(\xi) d\xi \geq -C \lambda^2 \int_\Omega v^2(\xi) d\xi,$$  \hfill (1.17)

the last term of (1.16) might create problems for getting estimate (1.12). The first task in proving estimate (1.12) is therefore to show that there exists $\mathcal{N}_1(\Gamma)$ so that

$$\left| \int_\Omega d\xi \eta_1(\xi) v(\xi) (J^\lambda \ast \eta_2 v)(\xi) \right| \leq C \lambda^2 \|v\|^2_{L^2(\Omega)}.$$  \hfill (1.18)

This is proven at the beginning of the proof of Theorem 2.4. The following step is to show (1.17). We write the quadratic form on the left hand side of (1.17) in local variables. Notice that the integrals are on the set $\mathcal{N}(\Gamma)$. In these local variables the convolution operator $(J^\lambda \ast \eta_1 v)(\xi)$ becomes equal, up to order $\lambda^2$, to an operator which is not a convolution anymore but it is still self-adjoint with respect to a weighed Lebesgue measure on $T$, see Lemma 4.1. In this way we show, see Lemma 4.2, that setting

$$\hat{v}(s, r) = \sqrt{\alpha(s, r)} v(s, r)$$

$$\int_\Omega (A^\lambda_{m, A} \eta_1 v)(\xi) \eta_1 v(\xi) d\xi \geq \int_T dsdr (L^\lambda \hat{v})(s, r) \hat{v}(s, r) - C \lambda^2 \|v\|^2_{L^2(\Omega)}.$$  \hfill (1.19)

It turns out that the operator $L^\lambda$ is conjugate to the operator $\mathbb{I} - P^\lambda$, where $P^\lambda$ is an integral operator, positivity improving. Therefore $L^\lambda$ and $\mathbb{I} - P^\lambda$ have the same spectrum. By the Perron –Frobenius Theorem we know that the principal eigenfunction is point wise positive. To estimate the principal eigenvalue we still need other ingredients. We show that when the operator $L^\lambda$ acts on functions depending only on the signed distance $r$ from $\Gamma$, becomes equal, up to order $\lambda^2$, to a one dimensional operator $L^\lambda_{1,s}$, $s \in T$. The knowledge of the spectrum of $L^\lambda_{1,s}$ (obtained using the results of [14]) together with the properties of the eigenfunctions associated to the principal eigenvalues of $L^\lambda_{1,s}$ and $P^\lambda$ allows to
upper and lower bound the principal eigenvalue $\mu_0$ of $L^\lambda$. In this way we show that $-C\lambda^2 \leq \mu_0 \leq C\lambda^2$. Hence (1.17) follows. To prove the $H^{-1}(\Omega)$ lower bound, see (1.11), we cannot proceed as in [2] and in [7]. For the non local operator (1.10) a bound on its quadratic form does not imply any bound on the gradient of the function. Nevertheless, we are still able to show that when

$$
\int_{\Omega} (A^\lambda_m q_1 v)(\xi)q_1 v(\xi) d\xi \leq \lambda^2 \|v\|^2_{L^2(\Omega)}
$$

(1.20)

then $v$ in local variables enjoys the following decomposition, see Theorem 6.1,

$$
v(s,r) = Z(s) \frac{1}{\sqrt{\lambda}} \psi_0^0\left(\frac{r}{\lambda}\right) + v^R(s,r)
$$

(1.21)

where $\|Z\|_{L^2(T)} \approx 1$, $\|\nabla Z\|_{L^2(T)} \leq C$, $\|v^R\|_{L^2(\mathbb{N}(\Gamma))} \leq C\lambda^2$ and $\psi_0^0(\cdot)$ is a strictly positive, even, smooth function, exponential decreasing. In such a way we obtain a decomposition similar to the one in [2] and [7] and we can proceed as in [7] to prove (1.14). To prove the decomposition (1.21) a more complete analysis of the spectrum of the operator $L^\lambda$ is needed. Let $\{\mu_k\}_{k \in \mathbb{N}}$ be the eigenvalues of $L^\lambda$ in $L^2(T)$. Essentially we prove that $-C\lambda^2 + c_0 k^2 \lambda^2 \leq \mu_k \leq C\lambda^2 + c_1 k^2 \lambda^2$, for $k \leq \frac{h_0}{\lambda}$ and, for $k > \frac{h_0}{\lambda}$, $\mu_k \geq \nu > 0$, where $C$, $c_0$, $c_1$, $h_0$ and $\nu$ are positive, real numbers independent on $\lambda$. In addition, when $k < \frac{h_0}{\lambda}$, we also need, and establish, a precise knowledge of the shape of the associated eigenfunctions. To obtain such informations on the spectrum of the operator $L^\lambda$ we make a judicious use of Fourier analysis.

Acknowledgements I am indebted to Sao Carvalho and Eric Carlen for discussions on this and related problems, discussions which started many years ago when visiting Georgia Tech and never stopped. I also benefited from suggestions by Carlangelo Liverani.

2. Notations and Results

Let $\Omega$ be a bounded domain in $\mathbb{R}^2$ with sufficiently smooth boundary and let $\Gamma \subset \Omega$ be a simple, smooth, closed curve, boundary of an open set $\Omega^-$. We denote by $\Omega^+ = \Omega \setminus (\Omega^- \cup \Gamma)$. We denote by $C$ a constant which might change from one occurrence to the other, independent on $\lambda$.

2.1. The interaction $J^\lambda$. Let $J$ be a smooth spherically symmetric, translation invariant, probability density on $\mathbb{R}^2$ with compact support, $\{\xi \in \mathbb{R}^2 : |\xi| \leq 1\}$. We assume $J \in C^1(\mathbb{R}^2)$. We say that $\xi \in \mathbb{R}^2$ and $\xi' \in \mathbb{R}^2$ interact each other if $J(\xi - \xi') > 0$. For $\xi = (\xi_1, \xi_2)$ we denote

$$
\bar{J}(\xi_1) = \int_{\mathbb{R}} J(\xi)d\xi_2,
$$

(2.1)

and for $\lambda \in (0, 1]$

$$
J^\lambda(\xi) = \frac{1}{\lambda^2} J\left(\frac{\xi}{\lambda}\right), \quad \bar{J}^\lambda(\xi_1) = \frac{1}{\lambda} \bar{J}\left(\frac{\xi_1}{\lambda}\right).
$$

The scaling is such that for all $\lambda \in (0, 1]$

$$
\int_{\mathbb{R}^2} J^\lambda(\xi)d\xi = 1, \quad \int_{\mathbb{R}} \bar{J}^\lambda(\xi_1)d\xi_1 = 1.
$$

2.2. Interaction in bounded domain. In a bounded domain $Q$ we require the interaction to act only when $\xi$ and $\xi'$ are in $Q$. Let $v$ be a function having support $Q$. We denote for $\xi \in Q$

$$
(J \ast v)(\xi) = (J \ast_Q v)(\xi) = \int_{Q} J(\xi - \xi')v(\xi')d\xi'.
$$

(2.2)

We do not add the suffix $Q$, unless confusion arises. Same notation when $J$ is replaced by $J^\lambda$. 
2.3. Local variables in a neighborhood of \( \Gamma \). We parametrize \( \Gamma \) by arc length. Let \( L \) be the length of \( \Gamma \) and let \( T \) be a circle of length \( L \). Let \( \gamma : T \to \Gamma \) be the map parametrizing \( \Gamma \) so that for \( s \in T \), \( |\gamma'(s)| = 1 \). We assume \( \gamma \in C^5(T) \). We denote by \( \nu(s) \) a smoothly varying unit vector normal to \( \Gamma \) at the point \( \gamma(s) \). We denote by \( k(s) \) the signed curvature defined by \( \nu'(s) = -k(s)\gamma'(s) \). We therefore have

\[
|\nu(s)| = 1, \quad |\gamma'(s)| = 1, \quad \nu'(s) = -k(s)\gamma'(s), \quad \gamma''(s) = k(s)\nu(s), \quad \gamma'(s) \cdot \nu(s) = 0,
\]

where for two vectors \( w_1 \) and \( w_2 \) in \( \mathbb{R}^2 \), \( w_1 \cdot w_2 \) is the scalar product. Let \( d(\xi, \Gamma) \) be the euclidean distance of the point \( \xi \) from \( \Gamma \) and \( r = r(\xi, \Gamma) \) be the signed distance of a point \( \xi \) from \( \Gamma \) with the convention that \( r < 0 \) when \( \xi \in \Omega^- \) and \( r > 0 \) when \( \xi \in \Omega^+ \). Let \( d_0 > 0 \) be so that

\[
\mathcal{N}(d_0) = \{ \xi \in \mathbb{R}^2 : d(\xi, \Gamma) \leq d_0 \} \subset \Omega.
\]

We require \( d_0 \) to be small enough so that the map \( \rho : T \times [-d_0, d_0] \to \mathcal{N}(d_0) \),

\[
\xi = \gamma(s) + \nu(s)r = \rho(s, r), \quad (2.4)
\]

is a diffeomorphism. We denote \( I = [-d_0, d_0] \), \( T = T \times I \) and \( \alpha(s, r) \) for \( (s, r) \in T \) the Jacobian of the local change of variables

\[
\alpha(s, r) = \det \left( \frac{\partial \rho(s, r)}{\partial (s, r)} \right) = 1 - rk(s), \quad (2.5)
\]

We further require \( d_0 \) to be small enough so that

\[
\sup_{s \in T} |k(s)|d_0 \leq \frac{1}{2}. \quad (2.6)
\]

This implies \( \frac{3}{2} \geq \alpha(s, r) \geq \frac{1}{2} \) for all \( (s, r) \in T \).

A function \( u(\xi) \) for \( \xi \in \mathcal{N}(d_0) \) becomes by the change of coordinates \( v(s, r) = u(\rho(s, r)), (s, r) \in T \). In the sequel we identify functions of variable \( \xi \) and functions of variable \( (s, r) \) in the domain \( \mathcal{N}(d_0) \). We often lift the function \( v \) on the universal cover of \( T \) without mentioning. We write

\[
\int_{\mathcal{N}(d_0)} u(\xi)d\xi = \int_T u(s, r)\alpha(s, r)dsdr \quad (2.7)
\]

and for \( v \) and \( w \) in \( L^2(T) \)

\[
\langle v, w \rangle = \int_T v(s, r)w(s, r)dsdr. \quad (2.8)
\]

2.4. The approximate solution \( m_A(\cdot) \). Let \( \beta > 1 \), \( m_\beta \) be the strictly positive solution of \( m = \tanh(\beta \tilde{m} \star m)(z) \) in \( \mathbb{R} \), \( m(0) = 0 \), \( \lim_{|z| \to \infty} m(z) = \pm m_\beta \). (2.9)

Notice that \( m_\beta < 1 \) and it can be proven that \( \tilde{m} \in C^\infty(\mathbb{R}) \), it is strictly increasing, and there exist \( a > 0 \), \( \alpha > \alpha_0 > 0 \) and \( c > 0 \) so that

\[
0 < m_\beta^2 - \tilde{m}(z) \leq ce^{-\alpha|z|}, \quad |\tilde{m}'(z) - a\alpha e^{-\alpha|z|}| \leq ce^{-\alpha|z|}. \quad (2.10)
\]

A proof of these estimates and related results can be found in [16, Chapter 8, Section 8.2]. We assume that \( m_A(\cdot) \in \mathcal{N}(d_0) \) has the expansion

\[
m_A(\xi) = \tilde{m}\left(\frac{r(\xi, \Gamma)}{\lambda}\right) + \lambda h_1\left(\frac{r(\xi, \Gamma)}{\lambda}\right) g(s(\xi)) + \phi(\xi) + \lambda^2q^1(\xi) \quad \xi \in \mathcal{N}(d_0). \quad (2.11)
\]

We assume that \( h_1 \in C^1(\mathbb{R}) \cap L^\infty(\mathbb{R}), \lim_{|z| \to \infty} h_1(z) = 0 \) exponentially fast and that \( h_1 \) is an even function. Hence if \( v \) is an odd function

\[
\int_R h_1(z)v(z)dz = 0. \quad (2.12)
\]
In particular, since \( \bar{m} \) is an odd function,
\[
\int_{\mathbb{R}} \frac{\bar{m}(z)}{\sigma^2(\bar{m}(z))} h_1(z)(\bar{m}'(z))^2dz = 0
\]  
(2.13)
where \( \sigma(m) = \beta(1 - m^2) \), see Remark 2.2. We assume that \( g \) and \( \phi \) are smooth functions, at least \( C^3 \),
\[
\sup_{\lambda \in [0,1]} \sup_{\xi \in \mathcal{N}(d_0)} (g(s(\xi)) + \phi(\xi) + q^\lambda(\xi)) \leq C,
\]  
(2.14)
and
\[
|\nabla^\Gamma m_A(\xi)| \leq C\lambda, \quad \xi \in \mathcal{N}(d_0),
\]  
(2.15)
where \( \nabla^\Gamma \) is the tangential derivative to \( \Gamma \). The function \( \phi(\cdot) \) has a Lipschitz norm bounded uniformly with respect to \( \lambda \):
\[
\|\phi\|_{\text{Lip}(\mathcal{N}(d_0))} \leq C.
\]  
(2.16)
We assume that away of the interface,
\[
m_A(\xi) \approx \pm m_\beta \quad \xi \in \Omega^\pm \cap [\Omega \setminus \mathcal{N}(d_0)]
\]
where \( \approx \) means up to correction of order \( \lambda \). We require that there exist \( C^* > 1, a > 0 \) and \( \lambda_0 > 0 \) so that for \( \lambda \leq \lambda_0 \)
\[
\inf_{\xi \in \Omega, \mathcal{N}(d_0)} \frac{1}{\sigma(m_A(\xi))} > C^*,
\]  
(2.17)
and
\[
a \leq \sigma(m_A(\xi)) \leq \beta, \quad \xi \in \Omega.
\]  
(2.18)

**Remark 2.1.** The assumptions regarding \( m_A \) are suggested by the preliminary results obtained by applying the method of [5] to the construction of approximate solutions of (1.8). The condition (2.15) is stronger than the corresponding requirement used in proving the spectral estimates in the Cahn-Hilliard case. In [7], it is required \( |\nabla^\Gamma m_A(\xi)| \leq C \); for \( \xi \in \mathcal{N}(d_0) \), although the function approximating the solution of the Cahn-Hilliard case constructed in [1] satisfies condition (2.15), see [1, formula (5.2)].

**Remark 2.2.** Condition (2.13) corresponds to the condition required by Alikakos, Fusco and Chen in the Cahn-Hilliard case, see for example [7, formula (1.12)]. In the Chen notation one needs
\[
\int_{\mathbb{R}} f''(\bar{m}(z))h_1(z)(\bar{m}'(z))^2dz = 0,
\]  
(2.19)
where \( f''(\cdot) \) is the third derivative of a double well potential. Let \( V(m) \) be the double well potential defined in (1.3). We have \( f(m) = V'(m) = -m + \frac{1}{2} \ln \frac{1 + m}{1 - m} \), \( f'(m) = -1 + \frac{1}{m(1 - m)} \), \( f''(m) = 2 \frac{m^2}{m^2 - 1} \). Inserting this into (2.19) gives condition (2.13).

### 2.5. Main Results

Denote by \( A_{m_A}^\lambda \) the operator acting on functions \( v \in L^2(\Omega) \):
\[
(A_{m_A}^\lambda v)(\xi) = \frac{v(\xi)}{\sigma(m_A(\xi))} - (J^\lambda \ast_{\Omega} v)(\xi) \quad \xi \in \Omega.
\]  
(2.20)
For \( \lambda \leq \lambda_0 \), \( \sigma(m_A(\xi)) \) is strictly positive for \( \xi \in \Omega \), see (2.18), therefore the operator (2.20) is well defined. Denote
\[
\mathcal{X} = \left\{ v \in H^1(\Omega) : \Delta v = v, \int_\Omega v = 0 \right\}.
\]
We have the following main result.

**Theorem 2.3.** Set \( \beta > 1 \). There exists \( \lambda_1 > 0 \) such that for \( \lambda \in (0, \lambda_1) \)
\[
\inf_{v \in \mathcal{X}} \frac{1}{\lambda} \int_\Omega \left( A_{m_A}^\lambda v(\xi) \right) v(\xi)d\xi \int_\Omega |\nabla w(\xi)|^2d\xi \geq -C.
\]  
(2.21)

The proof of Theorem 2.3 is based on two important intermediate results.
Theorem 2.4. Set $\beta > 1$. There exists $\lambda_2$ such that for $\lambda \in (0, \lambda_2)$
\[
\int_{\Omega} A_{\lambda}^v v(\xi)v(\xi)d\xi \geq -C\lambda^2 \int_{\Omega} v^2(\xi)d\xi.
\]

Theorem 2.5. Set $\beta > 1$. There exists $\lambda_4$ such that if for $\lambda \leq \lambda_4$, $v \in \mathcal{X}$
\[
\int_{\Omega} A_{\lambda}^v v(\xi)v(\xi)d\xi \leq C\lambda^2 \int_{\Omega} v^2(\xi)d\xi
\]
then
\[
\|\nabla w\|^2_{L^2(\Omega)} \geq C\lambda\|v\|^2_{L^2(\Omega)}.
\]
where $w$ solves $\Delta w = v$ in $\Omega$ with Neumann boundary conditions on $\partial\Omega$.

Theorem 2.4 and Theorem 2.5 imply the thesis of Theorem 2.3. Preliminary to our analysis is the study of the spectrum of one dimensional linear operators. This is done in Section 3. In Section 4 we prove Theorem 2.4. In Section 5 we study the spectrum of a two dimensional convolution operator. The knowledge of it allows to prove in Section 6 the representation theorem for function $v$ so that (1.21) holds. This is the main ingredient to show Theorem 2.5 which is proven in Section 7. In the Appendix, Section 8, we collect some estimates needed to prove the results.

3. ONE DIMENSIONAL CONVOLUTION OPERATORS IN ENLARGED INTERVALS.

Denote by $z = \frac{\xi}{s}$ the stretched variable and by $I_\lambda = [-\frac{\lambda}{s}, \frac{\lambda}{s}]$ the stretched interval. Also we denote by $v$ the generic function of $(s, r)$ and by $V$ the generic function of $(s, z)$. Define for $V \in L^2(I_\lambda)$ the following operator
\[
(\mathcal{L}^0 V)(z) = \frac{V(z)}{\sigma(\bar{m}(z))} - (\bar{J} \ast_{I_\lambda} V)(z), \quad z \in I_\lambda.
\]

Preliminary to the analysis of the spectrum of $\mathcal{L}^0$ is the knowledge of the spectrum of the following operator $\mathcal{L}$ defined on the space $L^2(\mathbb{R})$.
\[
(\mathcal{L} V)(z) = \frac{V(z)}{\sigma(\bar{m}(z))} - (\bar{J} \ast V)(z), \quad z \in \mathbb{R}.
\]
The spectral properties of $\mathcal{L}$ are given in [8]. The spectrum of $\mathcal{L}$ is positive, the lower bound of the spectrum is 0 which is an eigenvalue of multiplicity one and the corresponding eigenvalue is $\bar{m}'(\cdot)$, i.e
\[
\mathcal{L}\bar{m}' = 0.
\]
The remaining part of the spectrum is strictly bigger then some positive number. The operator $\mathcal{L}^0$ is the “restriction” of the operator $\mathcal{L}$ in the bounded interval $I_\lambda$. The spectrum of $\mathcal{L}^0$ is studied in [14].

We collect in Theorem 3.1 stated below the main results. Denote
\[
(V, W) = \int_{I_\lambda} V(z)W(z)dz, \quad \|V\|^2 = \int_{I_\lambda} V(z)^2dz.
\]

Theorem 3.1 ([14]). For any $\beta > 1$ there exists $\lambda_0(\beta)$ so that for $\lambda \leq \lambda_0(\beta)$ the following holds.

(0) The operator $\mathcal{L}^0$ is a bounded, self adjoint operator on $L^2(I_\lambda)$.
(1) There exist $\mu^0_0 \in \mathbb{R}$ and $\psi^0_0 \in L^2(I_\lambda)$, $\psi^0_0$ strictly positive in $I_\lambda$ so that
\[
\mathcal{L}^0 \psi^0_0 = \mu^0_0 \psi^0_0.
\]
The eigenvalue $\mu^0_0$ has multiplicity one.
\[
0 < \mu^0_0 \leq C e^{-2\beta},
\]
where $\alpha > 0$ is given in (2.10). Further $\psi_0^0 \in C^\infty(I_\lambda)$, $\psi_0^0(z) = \psi_0^0(-z)$ for $z \in I_\lambda$. The spectrum of $\mathcal{L}_\lambda^0$ is discrete and any other eigenvalue is strictly bigger than $\mu_0^0$.

(2) Let $\mu_2^0$ be the second eigenvalue of $\mathcal{L}_\lambda^0$ and $D > 0$ independent on $\lambda$. We have that

$$
\mu_2^0 = \inf_{(V, \psi_0^0) = 0; \|V\| = 1} (V, \mathcal{L}_\lambda^0 V) \geq D.
$$

(3) Let $\psi_0^0$ be the normalized eigenfunction corresponding to $\mu_0^0$ we have

$$
\|\psi_0^0 - \bar{m}\| \leq C e^{-2\lambda}.
$$

The point (0) it is easy to prove. To show point (1) one first notes that the Perron-Frobenius Theorem holds for the operator $(\mathcal{P}_0^0 g)(z) = p(z)(\bar{J} \ast I_\lambda) g(z)$, $g \in L^2(I_\lambda)$, since $\bar{J}$ is a positivity improving integral kernel. The operator $\mathcal{L}_\lambda^0$ is conjugate to the operator $\mathbb{I} - \mathcal{P}_0^0$. This implies immediately the result stated in point (1). Estimate (3.6) is obtained by applying the operator to a convenient trial function and using (2.13). The most difficult part is to show point (2). This has been obtained by applying a generalization of Cheeger’s inequality. For more details see [14]. Next we introduce a family of one dimensional operators. For any $s \in T$ and for $m_A$ given in (2.11), let

$$
(\mathcal{L}_s V)(s, z) = \frac{V(s, z)}{\sigma(m_A(s, \lambda z))} - (\bar{J} \ast I_\lambda \ast V)(s, z), \quad z \in I_\lambda
$$

be the operator acting on $L^2(I_\lambda)$ where

$$
(\bar{J} \ast I_\lambda \ast V)(s, z) = \int_{I_\lambda} \bar{J}(z - z') V(s, z') dz'.
$$

We stress that $\mathcal{L}_s$ acts for any fixed $s$ only on the $z$ variable of $V$. We denote

$$
\langle V, W \rangle_s = \int_{I_\lambda} V(s, z) W(s, z) dz, \quad \|V\|_s = \int_{I_\lambda} V(s, z)^2 dz.
$$

By the definition of $m_A$ given in (2.11) we have

$$
\frac{1}{\beta(1 - m_2^A(s, \lambda z))} = \frac{1}{\beta(1 - \bar{m}^2(z))} \left[ 1 + \lambda \frac{2\bar{m}(z)}{(1 - \bar{m}^2(z))} \left[ h_1(z) \phi(s, \lambda z) + \phi(s, \lambda z) \right] + q^\lambda(s, \lambda z) \lambda^2. \right. \quad (3.10)
$$

By the point wise bound (2.14) we have that

$$
\left| \frac{1}{\beta(1 - m_2^A(s, \lambda z))} - \frac{1}{\beta(1 - \bar{m}^2(z))} \right| \leq C \lambda.
$$

Therefore the operator $\mathcal{L}_s$ is for each $s \in T$, a $\lambda$–perturbation of the operator $\mathcal{L}_\lambda^0$, i.e.

$$
\sup_{\|V\| = 1} |\langle (\mathcal{L}_s - \mathcal{L}_\lambda^0) V, V \rangle_s| \leq C \lambda.
$$

Nevertheless, by (2.13), it is possible to show that the perturbation on the principal eigenvalue of $\mathcal{L}_\lambda^0$ is of order $\lambda^2$. We have the following result.

**Theorem 3.2.** For any $\beta > 1$ there exists $\lambda_0 = \lambda_0(\beta)$ so that for $\lambda < \lambda_0$ the following holds.

(1) For all $s \in T$, the operator $\mathcal{L}_s$ is a bounded, selfadjoint operator on $L^2(I_\lambda)$. There exist $\mu_1(s) \in \mathbb{R}$ and $\Psi_1(s, \cdot) \in L^2(I_\lambda)$, $\Psi_1(s, \cdot)$ strictly positive in $I_\lambda$ so that

$$
\mathcal{L}_s \Psi_1(s, \cdot) = \mu_1(s) \Psi_1(s, \cdot).
$$

The eigenvalue $\mu_1(s)$ has multiplicity one and any other point of the spectrum is strictly bigger than $\mu_1(s)$. 

(2) We have that for all $s \in T$

$$C\lambda^2 \geq \mu_1(s) = \inf_{\|V\|_s=1} \langle \mathcal{L}^s V, V \rangle_s \geq -C\lambda^2,$$  \quad (3.12)

$$\Psi_1(s, \cdot) = \frac{1}{\|m\|} \tilde{m}'(\cdot) + \Psi_1^R(s, \cdot)$$ \quad (3.13)

where

$$\sup_{s \in T} \|\Psi_1^R(s)\|_s \leq C \lambda.$$ \quad (3.14)

Moreover, there exist $z_1 > 0$ and $\zeta_1 > 0$ independent on $\lambda$ so that

$$\Psi_1(s, z) \geq \zeta_1, \quad |z| \leq z_1, \quad s \in T.$$ \quad (3.15)

(3) There exists $\gamma > 0$ such for every $\lambda \in (0, \lambda_0]$ and $s \in T$

$$\mu_2(s) = \inf_{\langle \Psi, \Psi \rangle_s = 0; \|\Psi\|_s = 1} \langle \Psi, \mathcal{L}^s \Psi \rangle_s \geq \gamma.$$ \quad (3.16)

(4)

$$\sup_{s \in T} \|\nabla_s \Psi_1\|_s \leq C \|\nabla_s m_A\|_{L^\infty(N(d))}.$$ \quad (3.17)

**Proof.** By the symmetry of $\bar{J}$ and (2.18), immediately one gets that $\mathcal{L}^s$ is a bounded, self-adjoint operator on $L^2(I_\lambda)$, for $s \in T$. Point (1) of the theorem follows by the positivity improving property of the integral kernel $\bar{J}$, similarly as done in proving point (1) of Theorem 3.1. As a consequence we have that the principal eigenvalue of the spectrum of $\mathcal{L}^s$, $\mu_1(s)$, has multiplicity one and any other point of the spectrum of $\mathcal{L}^s$ is strictly bigger than $\mu_1(s)$. Further the associated eigenfunction $\Psi_1(s, \cdot)$ does not change sign and we assume that it is positive.

(2) We show (3.12). Taking into account (3.10), we split the operator $\mathcal{L}^s$ as following

$$\langle \mathcal{L}^s V, V \rangle_s = \langle \mathcal{L}^0 V, V \rangle_s + \langle [\mathcal{L}^s - \mathcal{L}^0] V, V \rangle_s,$$ \quad (3.18)

where $\mathcal{L}^0$ is the operator defined in (3.1). We write

$$\langle [\mathcal{L}^s - \mathcal{L}^0] V, V \rangle_s = I_{2,s}(V) + I_{3,s}(V) + I_{4,s}(V)$$ \quad (3.19)

where

$$I_{2,s}(V) = \lambda^2 g(s) \int_{I_\lambda} dz \, \frac{1}{\sigma^2(\bar{m}(z))} \bar{m}(z) h_1(z) V(s, z)^2,$$ \quad (3.20)

$$I_{3,s}(V) = \lambda^2 \beta \int_{I_\lambda} dz \, \frac{1}{\sigma^2(\bar{m}(z))} \bar{m}(z) \phi(s, \lambda z) V(s, z)^2,$$ \quad (3.21)

$$I_{4,s}(V) = \lambda^2 \beta \int_{I_\lambda} dz \, \frac{1}{\sigma^2(\bar{m}(z))} \bar{m}(z) q^1(s, \lambda z) V(s, z)^2.$$ \quad (3.22)

Take as trial function

$$\tilde{V}(s, z) = \frac{\tilde{m}'(z)}{\|\tilde{m}\|_{L^2(I_\lambda)}} \quad s \in T, \quad z \in I_\lambda.$$ \quad (3.23)

By the variational form for the eigenvalues

$$\mu_1(s) \leq \langle \tilde{V}, \mathcal{L}^s \tilde{V} \rangle_s = \langle \mathcal{L}^0 \tilde{V}, \tilde{V} \rangle_s + \langle [\mathcal{L}^s - \mathcal{L}^0] \tilde{V}, \tilde{V} \rangle_s.$$ \quad (3.24)
Next we compute the right hand side of (3.24). We have
\[
\langle \保住, \mathcal{L}^0 \保住 \rangle_s = \frac{1}{\|\保住\|^2_{L^2(\mathcal{I}_s)}} \int_{\mathcal{I}_s} dz \left\{ \frac{\保住'(z)}{\保住(m(z))} - (\保住^* \保住) (z) \right\} \保住'(z)
\]
\[
= \frac{1}{\|\保住\|^2_{L^2(\mathcal{I}_s)}} \int_{\mathcal{I}_s} dz \left\{ \frac{\保住'(z)}{\保住(m(z))} - (\保住^* \保住) (z) \right\} \保住'(z) - \frac{1}{\|\保住\|^2_{L^2(\mathcal{I}_s)}} \int_{\mathcal{I}_s} dz \保住'(z) \int_{\mathcal{I}_s} \保住(z - z') \保住'(z') dz'
\]
\[
= - \frac{1}{\|\保住\|^2_{L^2(\mathcal{I}_s)}} \int_{\mathcal{I}_s} dz \保住'(z) \int_{\mathcal{I}_s} \保住(z - z') \保住'(z') dz'.
\]
(3.25)

since, see (3.3), \((\保住^* \保住)'(z) = \frac{\保住'(z)}{\保住(m(z))} - (\保住^* \保住)(z) = 0\). By (2.10) we have that
\[
|\langle \保住, \mathcal{L}^0 \保住 \rangle_s| \leq \frac{1}{\|\保住\|^2_{L^2(\mathcal{I}_s)}} \int_{\mathcal{I}_s} dz \保住'(z) \int_{\mathcal{I}_s} \保住(z - z') \保住'(z') dz' \leq C e^{-2a \mathcal{L}}. \tag{3.26}
\]

We split, as in (3.19), the second term in (3.24)
\[
\langle [\mathcal{L}^* - \mathcal{L}^0] \保住, \保住 \rangle_s = I_{2,s}(\保住) + I_{3,s}(\保住) + I_{4,s}(\保住). \tag{3.27}
\]

By condition (2.13)
\[
I_{2,s}(\保住) = 0.
\]

Applying again (2.13)
\[
I_{3,s}(\保住) = \lambda 2\beta \frac{1}{\|\保住\|^2_{L^2(\mathcal{I}_s)}} \int_{\mathcal{I}_s} dz \frac{1}{\保住(m(z))} \保住(z) [\保住(s, \保住) - \保住(s, 0)](\保住'(z))^2. \tag{3.28}
\]

By (2.16) and the exponentially decreasing of \保住', see (2.10), we have
\[
|I_{3,s}(\保住)| \leq \lambda 2\beta \frac{1}{\|\保住\|^2_{L^2(\mathcal{I}_s)}} \left| \int_{\mathcal{I}_s} dz \frac{1}{\保住(m(z))} \保住(z) [\保住(s, \保住) - \保住(s, 0)](\保住'(z))^2 \right| \leq \lambda^2 C.
\]

By (2.14) and (2.10), we have that
\[
I_{4,s}(\保住) \leq C \lambda^2.
\]

Therefore, recalling (3.26) we get
\[
\mu_1(s) \leq |\langle \保住, \mathcal{L}^0 \保住 \rangle_s| \leq C \lambda^2. \tag{3.29}
\]

We need to show \(\mu_1(s) \geq -C \lambda^2\). Let \(\保住_1(s, \cdot)\) be the normalized positive eigenfunction associated to \(\保住_1(s)\). Since \(\保住_1(s) \leq C \lambda^2\), by Lemma 8.1 stated in the Appendix, for \(\lambda\) small enough, \(\保住_1(s, \cdot)\) as function of \(z\) decays to zero exponentially fast for \(z\) large enough. Set
\[
\保住_1(s, \cdot) = a(s) \保住^0(\cdot) + (\保住^0)^\perp(s, \cdot), \tag{3.30}
\]
where \(\保住^0(\cdot)\) is the normalized eigenfunction associated to the principal eigenvalue of \(\mathcal{L}^0\), see (3.7),
\[
a(s) = \int_{\mathcal{I}_s} \保住_1(s, z) \保住^0(z) dz, \quad \int_{\mathcal{I}_s} \保住^0(z) (\保住^0)^\perp(s, z) dz = 0 \quad s \in T.
\]

By (3.18) we have that
\[
\mu_1(s) = \langle \保住_1, \mathcal{L}^0 \保住_1 \rangle_s = \langle \保住_1, \mathcal{L}^0 \保住_1 \rangle_s + \langle [\mathcal{L}^* - \mathcal{L}^0] \保住_1, \保住_1 \rangle_s. \tag{3.31}
\]

By (3.30) we obtain
\[
\langle \保住_1, \mathcal{L}^0 \保住_1 \rangle_s = a^2(s) \langle \保住^0, \保住^0 \rangle_s + \langle (\保住^0)^\perp, \mathcal{L}^0(\保住^0)^\perp \rangle_s \geq a^2(s) \保住^0 + \保住^0 \| (\保住^0)^\perp \|_s^2, \tag{3.32}
\]
where $\mu_0^1$ and $\mu_0^2$ are, respectively, the first and second eigenvalue of $\mathcal{L}^0$. We split the second term on the right hand side of (3.31) as in (3.27) obtaining
\[ \langle [\mathcal{L}^s - \mathcal{L}^0] \Psi_1, \Psi_1 \rangle_s = I_{2,s}(\Psi_1) + I_{3,s}(\Psi_1) + I_{4,s}(\Psi_1). \] (3.33)
By the $L^\infty$ bounds on $\sigma, q^s$ and $\tilde{m}$ we have
\[ |I_{4,s}(\Psi_1)| \leq C\lambda^2. \] (3.34)
Taking into account (3.30) we get
\[ I_{2,s}(\Psi_1) = \lambda g(s) \beta a(s) \int_{I_\lambda} dz \frac{1}{\sigma^2(\tilde{m}(z))} \tilde{m}(z) h_1(z) \psi_0^0(z)^2 + 2a(s) \psi_0^0(z)(\psi_0^0)^{\perp}(s, z) \right]. \] (3.35)
By (3.7) and (2.13) we have
\[ \left| \int_{I_\lambda} dz \frac{1}{\sigma^2(\tilde{m}(z))} \tilde{m}(z) h_1(z) (\psi_0^0)^{\perp}(s, z) \right|^2 \leq C e^{-\alpha}. \] (3.36)
By the $L^\infty$ bounds on $\sigma, h_1$ and $\tilde{m}$ we have
\[ \left| \int_{I_\lambda} dz \frac{1}{\sigma^2(\tilde{m}(z))} \tilde{m}(z) h_1(z) (\psi_0^0)^{\perp}(s, z) \right|^2 \leq C\| (\psi_0^0)^{\perp} \|_s. \] (3.37)
Therefore, by (3.36) and (3.37),
\[ |I_{2,s}(\Psi_1)| \leq \lambda C \| (\psi_0^0)^{\perp} \|_s. \] (3.38)
For the third term in the right hand side of (3.31), we have
\[ I_{3,s}(\Psi_1) = \lambda \beta \int_{I_\lambda} dz \frac{1}{\sigma^2(\tilde{m}(z))} \tilde{m}(z) f(0, s)(\Psi_1(s, z))^2 + \lambda \int_{I_\lambda} dz \frac{1}{\sigma^2(\tilde{m}(z))} \tilde{m}(z) [f(\lambda z, s) - f(0, s)](\Psi_1(s, z))^2 \] (3.39)
\[ \leq \lambda C \| (\psi_0^0)^{\perp} \|_s + C\lambda^2. \] We bound the first term on the right hand side of (3.39), as in (3.35), by splitting $\Psi_1$, see (3.30), taking into account that (2.13) hold. The bound for the second term on the right hand side of (3.39) is a consequence of the Lipschitz bound (2.16) for $f$ and the exponentially decay to zero of $\Psi_1(s, \cdot)$. Therefore, see (3.31), (3.32), (3.35) and (3.39) and (3.34) we obtain
\[ \langle \Psi_1, \mathcal{L}^s \Psi_1 \rangle_s \geq a^2(s) \mu_0^1 + \mu_0^2 \| (\psi_0^0)^{\perp} \|_s - \lambda \| (\psi_0^0)^{\perp} \|_s - C\lambda^2. \] (3.40)
By Theorem 3.1 we have that $\mu_0^1 \geq 0, \mu_0^2 \geq D$. This, together with the upper bound (3.29), implies
\[ \| (\psi_0^0)^{\perp} \|_s \leq C\lambda. \] (3.41)
Further, writing $\Psi_1$ as in (3.30) we have
\[ 1 = \| \Psi_1 \|_s^2 = a^2(s) \| \psi_0^0 \|_s^2 + \| (\psi_0^0)^{\perp} \|_s^2 = a^2(s) + \| (\psi_0^0)^{\perp} \|_s^2. \] Then
\[ a^2(s) = 1 - \| (\psi_0^0)^{\perp} \|_s^2 \geq 1 - C\lambda^2, \quad s \in T. \] (3.42)
From (3.40) and (3.41) we get therefore
\[ \langle \Psi_1, \mathcal{L}^s \Psi_1 \rangle_s \geq -C\lambda^2. \] (3.43)
Next we show (3.13). By (3.7) there exists a function $R(z)$, $z \in I_\lambda$, $\|R\| \leq C e^{-\frac{\lambda}{2}}$ so that $\psi_0(s) = \frac{\tilde{m}'(\cdot)}{\|\tilde{m}\|} + R(\cdot)$. Therefore by (3.30) we have

$$\Psi_1(s, \cdot) = a(s) \psi_0(s) + (\psi_0)\perp(s, \cdot) = a(s) \left[ \frac{\tilde{m}'(\cdot)}{\|\tilde{m}\|} + R(\cdot) \right] + (\psi_0)\perp(s, \cdot).$$

Denote by

$$\Psi_1^R(s, \cdot) = a(s) R(\cdot) + (\psi_0)\perp(s, \cdot).$$

By (3.41)

$$\|\Psi_1^R\|_s \leq \|\psi_0^\perp\|_s + C e^{-\frac{\lambda s}{2}} \leq C \lambda \quad \text{for } s \in T$$

and (3.13) is proven. The (3.15) is a consequence of exponential decay of $\Psi_1(s, \cdot)$, see Lemma 8.1. Further

$$\int_{I_\lambda} \Psi_1(s, z)^2 dz = 1, \quad \forall s \in T.$$ 

Therefore we must have that there exists $z_1 > 0$ independent on $\lambda$ so that

$$\int_{z_1}^{z_1} \Psi_1(s, z)^2 dz \geq \frac{1}{2}. \tag{3.44}$$

This implies that there exists $\zeta_1 > 0$, independent on $\lambda$ so that

$$\Psi_1(s, z) \geq \zeta_1, \quad |z| \leq z_1, \forall s \in T.$$ 

Namely, if this is false, there exists $\bar{z} \in [-z_1, z_1]$ so that $\Psi_1(s, \bar{z}) = 0$. Since $\bar{J}$ is positivity improving and $\Psi_1$ is an eigenfunction one can easily show that $\Psi_1(s, z) = 0$ for $z \in [-z_1, z_1]$. This is impossible since (3.44) holds.

(3) Let $\Psi_2(s, \cdot)$ be one of the normalized eigenfunctions corresponding to the second eigenvalue $\mu_2(s)$ of $L^\alpha$, then

$$\int_{I_\lambda} \Psi_1(s, z) \Psi_2(s, z) dz = 0, \quad \forall s \in T.$$ 

Split $\Psi_1(s, \cdot)$ as in (3.30). We obtain

$$0 = \langle \Psi_1, \Psi_2 \rangle_s = a(s) \langle \psi_0^0, \Psi_2 \rangle_s + \langle (\psi_0^0)\perp, \Psi_2 \rangle_s.$$

Therefore, taking into account (3.42),

$$\langle \psi_0^0, \Psi_2 \rangle_s = -\frac{1}{a(s)} \langle (\psi_0^0)\perp, \Psi_2 \rangle_s.$$

Hence, by (3.41),

$$\langle \psi_0^0, \Psi_2 \rangle_s \leq \frac{1}{|a(s)|} \|\psi_0^\perp\|_s \leq C \lambda. \tag{3.45}$$

Further we assume that $\mu_2(s)$ satisfies the hypothesis of Lemma 8.1. In fact either it is small and therefore satisfies the hypothesis of Lemma 8.1, either it is large, than there is nothing to prove. Then we can argue as in Lemma 8.1 and show that $\Psi_2(s, \cdot)$, as function of $z$ decays exponentially fast to zero. So we can decompose $\Psi_2(s, \cdot)$ as

$$\Psi_2(s, \cdot) = \langle \Psi_2, \psi_0^0 \rangle_s \psi_0^0(\cdot) + \left[ \Psi_2(s, \cdot) - \langle \Psi_2, \psi_0^0 \rangle_s \psi_0^0(\cdot) \right]. \tag{3.46}$$

We therefore obtain

$$\mu_2(s) = \langle L^\alpha \Psi_2, \Psi_2 \rangle_s = \langle L^0 \Psi_2, \Psi_2 \rangle_s + \langle [L^\alpha - L^0] \Psi_2, \Psi_2 \rangle_s.$$

By (3.19)

$$\|\mu_2(s) - L^0\|_s \Psi_2, \Psi_2 \rangle_s \leq C \lambda.$$
Then inserting (3.46) we have that
\[
\mu_2(s) \geq \mu_0^2 \langle \psi_2, \psi_0^2 \rangle + \mu_2^0 \left[ 1 - \langle \psi_2, \psi_0^2 \rangle \right] - C\lambda
\]
\[
\geq D\left[ 1 - C\lambda^2 \right] - C\lambda
\]
where $D > 0$ is the lower bound in (3.6) and we applied estimate (3.45). For $\lambda$ small enough, there exists $\gamma > 0$ so that (3.16) holds.

(4) To prove (3.17) we differentiate the eigenvalue equation for $\Psi_1$ with respect to $s$. We obtain
\[
[L^s - \lambda_1(s)]\Psi_1s = \mu_1(s)(s)\Psi_1 - \frac{d}{ds}\left( \frac{1}{\sigma(m_A)} \right) \Psi_1.
\]
(3.48)
Since
\[
\int \psi_1(z)\psi_1(z)dz = 0
\]
\[
\langle [L^s - \lambda_1(s)]\Psi_1s, \Psi_1s \rangle = -\langle \frac{d}{ds}\sigma(m_A)\Psi_1, \Psi_1s \rangle.
\]
(3.50)
Therefore,
\[
\langle [L^s - \lambda_1(s)]\Psi_1s, \Psi_1s \rangle \leq C\|\Psi_1s\|_s \|\nabla_s m_A\|_{L^\infty(\mathcal{N}(d_0))}.
\]
On the other hand, by (3.16)
\[
\langle [L^s - \lambda_1(s)]\Psi_1s, \Psi_1s \rangle \geq (\gamma - \lambda_1(s))\|\Psi_1s\|^2.
\]
Then
\[
\|\Psi_1s\|_s \leq \frac{C}{(\gamma - \lambda_1(s))} \|\nabla_s m_A\|_{L^\infty(\mathcal{N}(d_0))} \leq C\|\nabla_s m_A\|_{L^\infty(\mathcal{N}(d_0))}.
\]
(3.51)
This completes the proof of the theorem.

In the following we deal with functions defined in $I = [-d_0, d_0]$. To this end, for $u(s, \cdot) \in L^2(I)$, $s \in T$, denote
\[
(L_1^{\lambda,s} u)(s, r) = \frac{u(s, r)}{\sigma(m_A(s, r))} - (\bar{J}^\lambda \ast I, u)(s, r),
\]
(3.52)
where
\[
(\bar{J}^\lambda \ast I, u)(s, r) = \int_I \bar{J}^\lambda(r - r')u(s, r')dr'.
\]
(3.53)
The subscript 1 in (3.52) is to remind the reader that $L_1^{\lambda,s}$ acts only on functions of the $r-$ variable. We immediately have the following.

**Proposition 3.3.** The spectrum of $L_1^{\lambda,s}$ on $L^2(I)$ is equal to the spectrum of $L^s$ on $L^2(I)$. In particular the principal eigenvalue of $L_1^{\lambda,s}$ is
\[
\psi_1(s, r) = \frac{1}{\sqrt{\lambda}}\psi_1(s, \frac{r}{\lambda}),
\]
(3.54)
where $\Psi_1(s, \cdot)$ is the principal eigenvalue of $L^s$.

**Proof.** The operator $L^s : L^2(I) \to L^2(I)$ and the operator $L_1^{\lambda} : L^2(I) \to L^2(I)$ are conjugate. Namely, let $T : L^2(I \lambda) \to L^2(I)$ be the map so that $(TU)(s, r) = \frac{\lambda}{\lambda^2} U(s, \frac{r}{\lambda})$. The map $T$ is an isometry:
\[
\int_I ((TU)(s, r))^2dr = \int_I \frac{1}{\lambda} U^2(s, \frac{r}{\lambda})dr = \int_{I \lambda} U^2(s, z)dz
\]
and $L_1^{\lambda,s} = T L^s T^{-1}$. Therefore the spectrum of $L_1^{\lambda,s}$ is equal to the spectrum of $L^s$ and (3.54) holds.
4. $L^2$ estimates

This section is devoted to the proof of Theorem 2.4. Let $\eta(\cdot)$ be the indicator function of the set $\mathcal{N}(d_0)$, $\eta(\xi) = 1$ when $\xi \in \mathcal{N}(d_0)$, $\eta(\xi) = 0$ when $\xi \notin \mathcal{N}(d_0)$. In Subsection 4.1 we bound from below $\int_{\mathcal{N}(d_0)} (A^\lambda_{m_A} \eta u)(\xi) \eta(\xi) u(\xi) d\xi$ in term of the quadratic form of the local operator $L^\lambda$ defined in (4.6). Then, in Subsection 4.2 we bound from below the quadratic form of the local operator $L^\lambda$. Finally in Subsection 4.3 we show Theorem 2.4.

4.1. Bound from below of $\int_{\mathcal{N}(d_0)} (A^\lambda_{m_A} \eta u)(\xi) \eta(\xi) u(\xi) d\xi$. We start writing in local coordinates when $\xi \in \mathcal{N}(d_0)$ the integral $\int_{\mathcal{N}(d_0)} J^\lambda(\xi - \xi') u(\xi') d\xi'$. Let $\xi \in \mathcal{N}(d_0)$, $\xi = \rho(s, r)$, $(s, r) \in \mathcal{T}$ be the change of variables defined in (2.4), $u(s, r) = u(\rho(s, r))$ and $\alpha(s, r)$ as in (2.5). We have that

\[
\int_{\mathcal{N}(d_0)} J^\lambda(\xi - \xi') u(\xi') d\xi' = \int_{\mathcal{T}} J^\lambda(s, s', r, r') u(s', r') \alpha(s', r') ds' dr'
+ \int_{\mathcal{T}} R_1^\lambda(s, s', r, r') u(s', r') \alpha(s', r') ds' dr' \tag{4.1}
+ \int_{\mathcal{T}} R_2^\lambda(s, s', r, r') u(s', r') \alpha(s', r') ds' dr',
\]

where, for $s^* = \frac{s + s'}{2}$, $r^* = \frac{r + r'}{2}$ and $\alpha(s^*, r^*) = 1 - k(s^*)r^*$

\[
J^\lambda(s, s', r, r') = J^\lambda((s - s')\alpha(s^*, r^*), (r - r')), \tag{4.2}
\]

$R_1^\lambda$ is defined in (8.17) and $R_2^\lambda$ in (8.18). Further we have that

\[
\left| \int_{\mathcal{T}} R_1^\lambda(s, s', r, r') \alpha(s', r') ds' dr' \right| \leq C\lambda^2, \tag{4.3}
\]
\[
\left| \int_{\mathcal{T}} R_2^\lambda(s, s', r, r') \alpha(s', r') ds' dr' \right| \leq C\lambda^4. \tag{4.4}
\]

For the proof of the lemma it is enough that $\Gamma$ is a $C^3$ curve. The proof is simple although lengthy and it is reported in the appendix. The decomposition obtained in Lemma 4.1 turns out to be very useful. Set for $u \in L^2(\mathcal{T})$

\[
(B^\lambda u)(s, r) = \int_{\mathcal{T}} J^\lambda(s, s', r, r') \alpha(s^*, r^*) u(s', r') ds' dr', \tag{4.5}
\]

and

\[
(L^\lambda u)(s, r) = \frac{u(s, r)}{\sigma(m_A(s, r))} - (B^\lambda u)(s, r). \tag{4.6}
\]

The operator $L^\lambda$ is selfadjoint in $L^2(\mathcal{T})$. We have the following result.

**Lemma 4.2.** Let $\eta(\cdot)$ be the indicator function of the set $\mathcal{N}(d_0)$. Set

\[
\hat{u}(s, r) = \sqrt{\alpha(s, r)} u(s, r). \tag{4.7}
\]

We get that

\[
\int_{\mathcal{N}(d_0)} (A^\lambda_{m_A} \eta u)(\xi) \eta(\xi) u(\xi) d\xi \geq \langle \hat{u}, L^\lambda \hat{u} \rangle - \lambda^2 C\|u\|_{\mathcal{N}(d_0)}^2. \tag{4.8}
\]
Proof. By changing variables we have that
\[
\int_{\mathcal{N}(d_0)} (A^\lambda_{m_A} \eta u)(\xi)\eta u(\xi)d\xi = \int_{\mathcal{T}} dsdr\alpha(s,r)u(s,r)\left\{ \frac{u(s,r)}{\sigma(m_A(s,r))} - (J^\lambda \eta u)(s,r) \right\}.
\]
Taking into account Lemma 4.1 we have
\[
\int_{\mathcal{T}} dsdr\alpha(s,r)u(s,r)\left\{ \frac{u(s,r)}{\sigma(m_A(s,r))} - (J^\lambda \eta u)(s,r) \right\} \\
\geq \int_{\mathcal{T}} dsdr\alpha(s,r)u(s,r)\left\{ \frac{u(s,r)}{\sigma(m_A(s,r))} - \int_{\mathcal{T}} J^\lambda(s,s',r,r')u(s',r')\alpha(s',r')ds'dr' \right\} - \lambda^2 C\|u\|^2_{L^2(\mathcal{N}(d_0))}.
\]
By (4.3) and (4.4) one obtains
\[
\left| \int_{\mathcal{T}} dsdr\alpha(s,r)u(s,r) \int_{\mathcal{T}} ds'dr'R^\lambda(s,s',r,r')u(s',r')\alpha(s',r') \right| \leq C\lambda^2 \|u\|^2_{L^2(\mathcal{T},\alpha(s,r)dsdr)} = C\lambda^2 \|u\|^2_{L^2(\mathcal{N}(d_0))},
\]
\[
\left| \int_{\mathcal{T}} dsdr\alpha(s,r)u(s,r) \int_{\mathcal{T}} ds'dr'R^\lambda(s,s',r,r')u(s',r')\alpha(s',r') \right| \leq C\lambda^4 \|u\|^2_{L^2(\mathcal{T},\alpha(s,r)dsdr)} = C\lambda^4 \|u\|^2_{L^2(\mathcal{N}(d_0))}.
\]
Set \( \hat{u} \) as in (4.7) and
\[
(D^\lambda \hat{u})(s,r) = \sqrt{\alpha(s,r)} \int_{\mathcal{T}} J^\lambda(s,s',r,r')\sqrt{\alpha(s',r')}\hat{u}(s',r')ds'dr'.
\]
We have immediately that
\[
\int_{\mathcal{T}} dsdr\alpha(s,r)u(s,r) \left\{ \frac{u(s,r)}{\sigma(m_A(s,r))} - \int_{\mathcal{T}} J^\lambda(s,s',r,r')u(s',r')\alpha(s',r')ds'dr' \right\} \\
= \int_{\mathcal{T}} dsdr\hat{u}(s,r) \left\{ \frac{\hat{u}(s,r)}{\sigma(m_A(s,r))} - (D^\lambda \hat{u})(s,r) \right\} \\
= \int_{\mathcal{T}} dsdr \left\{ \frac{\hat{u}(s,r)}{\sigma(m_A(s,r))} - (B^\lambda \hat{u})(s,r) \right\} + \int_{\mathcal{T}} dsdr\hat{u}(s,r)(C^\lambda \hat{u})(s,r)
\]
where
\[
(C^\lambda \hat{u})(s,r) = \int_{\mathcal{T}} J^\lambda(s,s',r,r') \left[ \sqrt{\alpha(s,r)\alpha(s',r')} - \alpha(s^*,r^*) \right] \hat{u}(s',r')ds'dr'.
\]
By Lemma 4.3 given below we have that
\[
|\langle \hat{u}, C^\lambda \hat{u} \rangle| \leq C\lambda^2 \|\hat{u}\|^2_{L^2(\mathcal{T})},
\]
Taking into account definition (4.6), from (4.11) we get (4.8).

Lemma 4.3. Take \(|s-s'| \leq \lambda\) and \(|r-r'| \leq \lambda\). We have
\[
\sqrt{\alpha(s,r)\alpha(s',r')} = \alpha(s^*,r^*) \sqrt{1 + b(s,s',r,r')}
\]
where \( b(s,s',r,r') \) is defined in (4.17) and
\[
|b(s,s',r,r')| \leq C\lambda^2.
\]
Proof. Adding and subtracting \( k(s^*)r^* \) we have
\[
\alpha(s,r)\alpha(s',r') = \alpha(s^*,r^*)^2 + \alpha(s^*,r^*) \left[ 2k(s^*)r^* - k(s')r' - k(s)r \right] \\
+ [k(s^*)r^* - k(s')r'][k(s^*)r^* - k(s)r] + \alpha(s^*,r^*)^2 \left[ 1 + b(s,s',r,r') \right]
\]
(4.16)
where
\[ b(s, s', r, r') = \frac{2k(s^*)r - k(s')r' - k(s)r}{\alpha(s^*, r^*)} + \frac{[k(s^*)r - k(s')r']^2}{\alpha(s^*, r^*)^2}. \] (4.17)

Next we show (4.15). We have
\[ [2k(s^*)r - k(s')r' - k(s)r] = [k(s^*) - k(s)]r + [k(s^*) - k(s')][k(s) - k(s')]. \] (4.18)

Taylor expanding \( k(\cdot) \) we have
\[ k(s') = k(s^*) + k'(s^*)[s' - s^*] + \frac{1}{2}k''(s^*)[s' - s^*]^2 + \frac{1}{6}k'''(\tilde{s})[s' - s^*]^3, \] (4.19)

where \( \tilde{s} \in (s, s') \). Similarly we proceed for \( k(s) \). By (4.18), taking into account (4.19) and that \( s' - s^* = \frac{[s' - s]}{2} \) and \( s - s^* = \frac{[s - s']}{2} \) we obtain
\[ \frac{|[k(s^*) - k(s')]r' + [k(s^*) - k(s)]r|}{\alpha(s^*, r^*)} \lesssim \left| k'(s^*) \cdot \frac{[s' - s]}{2} [r - r'] + \frac{1}{4} k''(s^*) [s' - s^*]^2 r^* + \frac{1}{48} k'''(\tilde{s}) [s' - s^*]^3 [r - r'] \right| \lesssim C \lambda^2. \] (4.20)

By similar computations
\[ \frac{|[k(s^*)r - k(s')r'][k(s^*)r - k(s)r]|}{\alpha(s^*, r^*)} \lesssim C \lambda^2. \]

4.2. Properties of \( L^\lambda \). The operator \( L^\lambda \) acts on function of \((s, r)\). In Corollary 4.5, stated below, we show that when the operator \( L^\lambda \) acts on functions depending only on the variable \( r \), it is, in the \( L^2 \) norm, \( \lambda^2 \)-close to the one dimensional operator \( L^\lambda_{1,s} \), defined in (3.52). Preliminarily we need to see how the operator \( B^\lambda \), defined in (4.5), acts on functions depending only on \( r \). This is the content of the next lemma. The symmetry of \( J \) is essential to obtain the estimate (4.22).

**Lemma 4.4.** Let \( B^\lambda \) be the operator defined in (4.5) and \( v \) a function depending only on the \( r \) variable. For any \( s \in T \) we have
\[ (B^\lambda v)(r) = (\tilde{J}^\lambda \star_I v)(r) + (\Gamma^\lambda,s v)(r), \quad r \in I \] (4.21)
where \( \Gamma^\lambda,s \) is the operator defined in (4.26),
\[ |\Gamma^\lambda,s v(r)| \lesssim C \lambda^2 (J^\lambda \star_I |v|)(r), \quad r \in I. \] (4.22)

When \( v \in L^2(I) \),
\[ ||\Gamma^\lambda,s v||_{L^2(I)} \lesssim C \lambda^2 ||v||_{L^2(I)}. \] (4.23)

**Proof.** Taking into account that the support of \( J^\lambda \), see the definition of the operator \( B^\lambda \), is the ball of radius \( \lambda \) centred in \((s, r) \in T \) we make the following local change of variable: For each \((s, r) \in T \) and \( r' \in I \),
\[ w = f(s') = -(s - s') \alpha(s^*, r^*), \quad |s - s'| \leq \lambda. \] (4.24)

Notice that we are not explicitly writing the dependence on \((s, r, r')\). Denoting by \( f' \) the derivative with respect to \( s' \) of \( f \), we have
\[ f'(s') = \alpha(s^*, r^*) + \frac{1}{2}(s - s') k'(s^*) r^*. \]

By (2.6) and for \( \lambda \) small enough, \( f'(s') > 0 \) when \( |s - s'| \leq \lambda \). By the inverse function theorem we have
\[ ds' = \frac{1}{f'(s'(w))} dw, \quad f'(s'(w)) = \alpha(s^*(w), r^*) + \frac{1}{2} \frac{w}{\alpha(s^*(w), r^*)} k'(s^*(w)) r^*, \]
where by an abuse of notation we set \( s^*(w) = \frac{1}{2}s + \frac{1}{2}f^{-1}(w) \). We have

\[
(B^\lambda v)(r) = \int_{\mathcal{T}} J^\lambda((s - s')\alpha(s^*, r^*), (r - r'))\alpha(s^*, r^*)v(r')ds'dr'
= \int_{I} dr' \int_{f^{-1}((s - s') \leq \lambda)} J^\lambda(w, r - r')\alpha(s^*(w), r^*) \frac{1}{f'(s'(w))} v(r')dw
= \int_{I} dr' \int J^\lambda(w, r - r')v(r')dw + (\Gamma^{\lambda,s} v)(r)
\]

(4.25)

where

\[
(\Gamma^{\lambda,s} v)(r) = \int_{\mathcal{T}} dr'dw J^\lambda(w, r - r') \left[ \frac{1}{1 + \frac{w k'((s^*(w)) r^*)}{\alpha(s^*(w), r^*)^2}} - 1 \right] v(r').
\]

(4.26)

For \( r \) and \( r' \) in \( I \), the support of \( J^\lambda(w, r - r') \) is the ball of radius \( \lambda \) centered in the point \( (0, r) \in \mathcal{T} \). Hence we have for \( r \in I \) and \( r' \in I \)

\[
\int J^\lambda(w, r - r')dw = \tilde{J}^\lambda(r - r'),
\]

(4.27)

where \( \tilde{J}^\lambda \) is defined in Subsection 2.1. Therefore from (4.25), (4.26) and (4.27) we have (4.21). Denote shortly by \( a = \frac{w k'((s^*(w)) r^*)}{\alpha(s^*(w), r^*)^2} \). Since \( |w| \leq \lambda \) we have that \( |a| \leq CA \). Writing \( \frac{1}{1 + a} = \sum_{k=0}^{\infty} (-a)^k \) we have that

\[
\frac{1}{1 + a} - 1 = -a + \sum_{k=2}^{\infty} (-a)^k.
\]

Therefore from (4.25) we obtain

\[
(\Gamma^{\lambda,s} v)(r) = -\int_{I} dr' \int J^\lambda(w, r - r') \frac{w k'((s^*(w)) r^*)}{\alpha(s^*(w), r^*)^2} v(r')dw
+ \int_{I} dr' \int J^\lambda(w, r - r') \sum_{k=2}^{\infty} (-a)^k v(r')dw.
\]

(4.28)

For the second term we have

\[
\left| \int_{I} dr' \int J^\lambda(w, r - r') \sum_{k=2}^{\infty} (-a)^k v(r')dw \right| \leq C \lambda^2 \int_{I} dr' \int J^\lambda(w, r - r') v(r')dw = C \lambda^2 \int_{I} dr' \tilde{J}^\lambda(r - r') |v(r')|.
\]

(4.29)

For the first term of (4.28) develop in Taylor expansion around \( w = 0 \)

\[
\frac{k'((s^*(w)) r^*)}{\alpha(s^*(w), r^*)^2} = \frac{k'((s^*(0)) r^*)}{\alpha(s^*(0), r^*)^2} + g(\tilde{w})w
\]

where we denote by \( g \) the derivative of \( k'((s^*(w)) r^*)/\alpha(s^*(w), r^*)^2 \) with respect to \( w \). We have that

\[
\int_{[-d_0, d_0]} dr' \int J^\lambda(w, r - r') \frac{w k'((s^*(w)) r^*)}{\alpha(s^*(w), r^*)^2} v(r')dw
= \int_{[-d_0, d_0]} dr' \frac{k'((s^*(0)) r^*)}{\alpha(s^*(0), r^*)^2} v(r') \int J^\lambda(w, r - r')wdw
+ \int_{[-d_0, d_0]} dr' \int J^\lambda(w, r - r') g(\tilde{w})w v(r')dw.
\]

(4.30)
By the symmetry of $J^\lambda$

$$\int J^\lambda(w, r - r') dw = 0.$$ 

Since $|\hat{g}(\hat{w})| w^2 \leq C \lambda^2$, from (4.30), (4.29) and (4.28) we obtain

$$(\Gamma^{\lambda, s}) \alpha(s^*, r^*) \leq C \lambda^2 (\tilde{J}^\lambda \star |v|)(r). \quad (4.31)$$

□

**Corollary 4.5.** Let $v \in L^2(I)$ we have that

$$(L^\lambda v)(r) = (L_1^{\lambda, s} v)(r) + (\Gamma^{\lambda, s}) \alpha(s^*, r^*)$$

where $\Gamma^{\lambda, s}$ is the operator defined in (4.26) and

$$|\Gamma^{\lambda, s} v(r)| \leq C \lambda^2 (\tilde{J}^\lambda \star |v|)(r). \quad (4.32)$$

The proof is immediate by recalling the definition of $L^\lambda$ given in (4.6) and $L_1^{\lambda, s}$ given in (3.52).

**Corollary 4.6.**

$$\int_J J^\lambda(s, s', r, r') \alpha(s^*, r^*) ds' dr' = 1 + (\Gamma^{\lambda, s}) \alpha(s^*, r^*)$$

where we denote by $(\Gamma^{\lambda, s}) \alpha(s^*, r^*)$ the quantity defined in (4.26) when applied to the function $v(r) = 1$ for all $r \in I$ and

$$|\Gamma^{\lambda, s}) \alpha(s^*, r^*)| \leq C \lambda^2. \quad (4.33)$$

Further

$$\int_T J^\lambda(s, s', r, r') \alpha(s^*, r^*) ds' = J^\lambda(r - r') + (\Gamma^{\lambda, s}) \alpha(s^*, r^*)$$

where $\Gamma^{\lambda, s}$ is defined in (4.38),

$$|(\Gamma^{\lambda, s}) \alpha(s^*, r^*)| \leq C \lambda^2 J^\lambda(r - r'). \quad (4.34)$$

**Proof.** The proof of (4.34) is straightforward. Take $v(r) = 1$ in Lemma 4.4 and the thesis follows. To show (4.35), we proceed similarly as in Lemma 4.4. For $r$ and $r'$ in $I$, we have as in (4.25)

$$\int_J J^\lambda((s - s') \alpha(s^*, r^*), r - r') \alpha(s^*, r^*) ds'$$

$$= \int_J J^\lambda(w, r - r') \alpha(s^*, r^*) \frac{1}{f(s'(w))} dw$$

$$= \int_J J^\lambda(w, r - r') dw + (\Gamma^{\lambda, s}) \alpha(s^*, r^*) = J^\lambda(r - r') + (\Gamma^{\lambda, s}) \alpha(s^*, r^*)$$

where

$$(\Gamma^{\lambda, s}) \alpha(s^*, r^*) = \int_J J^\lambda(w, r - r') \left[ \frac{1}{1 + \frac{w k^2(s^*, r^*)}{(s^*, r^*)^2}} - 1 \right] dw. \quad (4.35)$$

Similarly as done in (4.28) and (4.29), (4.30) and (4.31) we have

$$|(\Gamma^{\lambda, s}) \alpha(s^*, r^*)| \leq C \lambda^2 J^\lambda(r - r'). \quad (4.36)$$

□
4.3. Two dimensional integral operators in enlarged bounded domains. Let $\mathcal{T}_\lambda$ be the enlarged cylinder

$$\mathcal{T}_\lambda = T \times I_\lambda, \quad I_\lambda = \left[ -\frac{d_0}{\lambda}, \frac{d_0}{\lambda} \right].$$

(4.40)

Notice that the circle $T$ is kept unchanged. Denote $z^* = \frac{z + z'}{2}$, $s^* = \frac{s + s'}{2}$ and, see (2.5),

$$\alpha(s^*, z^*) = 1 - \lambda k(s^*) z^*, \quad (4.41)$$

and

$$J^c(s, s', z, z') = \frac{1}{\lambda} J \left( \frac{(s - s')}{\lambda} \alpha(s^*, z^*), (z - z) \right) \alpha(s^*, z^*), \quad (4.42)$$

where $\lambda = \frac{d_0}{\lambda}$ is defined in (4.44). The operator $J^c$ is obtained by rescaling only the $r-$variable of the integral kernel defining the operator $B^\lambda$, see (4.5). Denote for $V \in L^2(\mathcal{T}_\lambda)$

$$\mathbf{(AV)}(s, z) = \frac{1}{\sigma(m_A(s, z))} V(s, z) - \int_{\mathcal{T}_\lambda} J^c(s, s', z, z') V(s', z') \, ds' \, dz', \quad (4.44)$$

where $J^c$ is defined in (4.42). We avoid to write explicitly the dependence on $\lambda$ on the previous notations, but the reader should bear in mind that if not explicitly written, there is almost always an hidden dependence on $\lambda$. In this section we study the spectrum of the integral operator $A : L^2(\mathcal{T}_\lambda) \to L^2(\mathcal{T}_\lambda)$, defined in (4.44). The operator $A$ is conjugate to $L^\lambda : L^2(\mathcal{T}) \to L^2(\mathcal{T})$, hence the spectrum of $A$ and $L^\lambda$ are the same, see Theorem 4.8 We have the following result.

**Theorem 4.7.** (0) The operator $A$ is a bounded, self adjoint operator on $L^2(\mathcal{T}_\lambda)$ with discrete spectrum.

1. There exist $\mu_0 \in \mathbb{R}$ and $\Phi_0 \in L^2(\mathcal{T}_\lambda)$, $\Phi_0$ strictly positive in $\mathcal{T}_\lambda$ so that

$$\mathcal{A}\Phi_0 = \mu_0 \Phi_0. \quad (4.45)$$

The eigenvalue $\mu_0$ has multiplicity one and any other point of the spectrum is strictly bigger than $\mu_0$.

2. There exists $\zeta_1 > 0$ and $z_1 > 0$ independent on $\lambda$ so that

$$\Phi_0(s, z) \geq \zeta_1, \quad |z| \geq z_1. \quad (4.46)$$

3. There exists $C > 0$ independent on $\lambda$ so that

$$-C \lambda^2 \leq \mu_0 \leq C \lambda^2. \quad (4.47)$$

The proof is given at the end of the subsection. This result immediately implies the following.

**Theorem 4.8.** Let $L^\lambda$ be the operator defined in (4.6). The spectrum of $L^\lambda$ is equal to spectrum of $A$. In particular we have

$$\langle u, L^\lambda u \rangle \geq \mu_0 \|u\|_{L^2(\mathcal{T})}^2 \geq -\lambda^2 C \|u\|_{L^2(\mathcal{T})}^2.$$

The thesis immediately follows by Theorem 4.7 and noticing that $L^\lambda$ and $A$ are conjugate. The proof is similar to the one given in Proposition 3.3. The following results are straightforward consequences of Lemma 4.4 and Corollary 4.6.

**Proposition 4.9.** Let $V \in L^2(I_\lambda)$. For any $s \in T$ we have

$$\mathbf{(BV)}(z) = (\mathcal{J}_s V)(z) + (\rho V)(z), \quad (4.48)$$

$$\int_{\mathcal{T}_\lambda} ds' dz' J^c(s, s', z, z') = 1 + (\rho^*) (z), \quad (4.49)$$

$$\int_{\mathcal{T}_\lambda} ds' J^c(s, s', z, z') = J(z - z') + (\rho_1^*) (z, z'), \quad (4.50)$$

$$|\rho^*(z)| \leq C \lambda^2 |J_s V|(z), \quad |\rho^*(z)| \leq C \lambda^2, \quad |\rho_1^*(z, z')| \leq C \lambda^2 J(z - z'). \quad (4.51)$$
Proof. Taking into account the definition of $J^c$, see (4.42), applying similar argument as in Lemma 4.4 and Corollary 4.6 one gets the statements. □

Denote
\[ p(s, z) = \sigma(m_A(s, z)), \quad (s, z) \in \mathcal{T}_\lambda, \]
\[ \mathcal{H} = \left\{ u : \int_{\mathcal{T}_\lambda} u(s, z)^2 \frac{1}{p(s, z)} dzds < \infty \right\}, \]
\[ \langle V, U \rangle = \int_{\mathcal{T}_\lambda} V(s, z)U(s, z) \frac{1}{p(s, z)} dzds, \]
\[ ||V||^2_{\mathcal{H}} = \int_{\mathcal{T}_\lambda} V(s, z)^2 \frac{1}{p(s, z)} dzds, \]
and $\mathcal{P}$ the linear integral operator acting on functions $V \in \mathcal{H}$
\[ (\mathcal{P}V)(s, z) = p(s, z) \int_{\mathcal{T}_\lambda} J^c(s, s', z, z')V(s', z')ds'dz'. \]
By the property of $m_A$ stated in Subsection 2.4, $\beta \geq p(s, z) > a > 0$ and $p \in C^1(T_\lambda)$.

**Theorem 4.10.** The operator $\mathcal{P}$ is a compact, self-adjoint operator on $\mathcal{H}$, positivity improving. Further, there exist $\nu_0 > 0$ and $V_0 \in \mathcal{H}$, $V_0$ strictly positive function, so that
\[ \mathcal{P}V_0 = \nu_0 V_0. \]

The eigenvalue $\nu_0$ has multiplicity one and any other point of the spectrum is strictly inside the ball of radius $\nu_0$. The eigenfunction $V_0 \in C^1(T_\lambda)$. Further there exists $z_1 > 0$ and $\zeta > 0$ independent on $\lambda$ so that
\[ V_0(s, z) \geq \zeta, \quad |z| \leq z_1, \forall s \in T. \]

Proof. It is immediate to see that
\[ \langle \mathcal{P}V, W \rangle = \langle V, \mathcal{P}W \rangle. \]
The compactness can be shown by proving that any bounded set of $\mathcal{H}$ is mapped by $\mathcal{P}$ in a relatively compact set. To show the positivity improving we take $V \geq 0$ in $T$, $V \neq 0$, and show that for all $(s, z) \in \mathcal{T}_\lambda$,
\[ (\mathcal{P}V)(s, z) > 0. \]
Namely, assume that there exists $(\bar{s}, \bar{z}) \in \mathcal{T}_\lambda$ so that $(\mathcal{P}V)(\bar{s}, \bar{z}) = 0$. Since $J^c \geq 0$ we have that $V(s, z) = 0$ for all $(s, z) \in Q_\lambda(\bar{s}, \bar{z}) = \{(s, z) \in \mathcal{T}_\lambda : |s - \bar{s}| \leq \lambda, |z - \bar{z}| \leq 1\}$. Repeating the same argument for points $(s, z)$ in $Q_\lambda(\bar{s}, \bar{z})$ we end up that $V(s, z) = 0$ for $(s, z) \in \mathcal{T}_\lambda$, obtaining a contradiction. Therefore the positivity improving property is proven. From the positivity hypothesis on $J^c$, there exists an integer $n_\lambda$ such that for $n \geq n_\lambda$, there is $\zeta > 0$ so that for any $x = (s, z)$ and $\bar{x} = (\bar{s}, \bar{z})$ in $\mathcal{T}_\lambda$
\[ \int dx_1dx_2...dx_n J^c(x, x_1)J^c(x_1, x_2)...J^c(x_n, \bar{x}) > \zeta. \]
Denote for $x \in T$ and $\bar{x} \in T$
\[ K(x, \bar{x}) = p(x) \int dx_1dx_2...dx_n p(x_1)J^c(x, x_1)p(x_2)J^c(x_1, x_2)...p(x_n)J^c(x_n, \bar{x}). \]
Then one can apply the classical Perron Frobenius Theorem to the kernel $K(\cdot, \cdot)$. As a consequence we have that the maximum eigenvalue of the spectrum of $\mathcal{P}$, which we denote $\nu_0$, has multiplicity one and any other point of the spectrum of $\mathcal{P}$ is strictly smaller than $\nu_0$. Let $V_0$ be the eigenfunction associated to $\nu_0$. Then it does not change sign and we assume that it is positive. Differentiating the eigenvalue equation, taking into account that $p \in C^1(T_\lambda)$ we get that $V_0 \in C^1(T_\lambda)$. Next we show (4.55). From
(4.61) of Lemma 4.11, stated below, we have that \( \int_{T} V_0(s, z)^2 ds \) is exponentially decreasing for \( |z| \geq z_0 \). Further
\[
\int_{T} \frac{1}{p(s, z)} V_0(s, z)^2 ds dz = 1.
\]
Therefore we must have that there exists \( z_1 > 0 \) independent on \( \lambda \) so that
\[
\int_{-z_1}^{z_1} \frac{1}{p(s, z)} \int_{T} V_0(s, z)^2 ds dz \geq \frac{1}{2}.
\]
This implies that there exists \( \zeta > 0 \), independent on \( \lambda \) so that
\[
V_0(s, z) \geq \zeta, \quad |z| \leq z_1, \forall s \in T.
\]
Namely, if this is false, there exists \((s, z) \in T \times [-z_1, z_1] \) so that \( V_0(s, z) = 0 \). Since \( \mathcal{P} \) is positivity improving and \( V_0 \) is an eigenfunction, repeating the argument done after formula (4.56), we get \( V_0(s, z) = 0 \) in \( T \times [-z_1, z_1] \). This is impossible since (4.59) holds. \( \square \)

**Lemma 4.11.** For any \( \epsilon_0 \in (0, \frac{(1-\sigma(m_\beta))}{2}) \) there exists \( \lambda_0 = \lambda_0(\epsilon_0) > 0 \) so that for \( \lambda \leq \lambda_0 \) the following holds. Let \( \nu > 1 - \epsilon_0 \) be an eigenvalue of the operator \( \mathcal{P} \) on \( \mathcal{H} \) and \( \Psi \) be any of the corresponding normalized eigenfunctions. There exists \( z_0 = z_0(\epsilon_0) \in \mathcal{T}_\lambda \) independent on \( \lambda \) so that
\[
|\Psi(s, z)| \leq \frac{C}{\sqrt{\lambda}} e^{-\alpha(\epsilon_0)|z|} ||\Psi||_{\mathcal{H}}, \quad |z| \geq z_0, \quad \forall s \in T,
\]
where \( \alpha(\epsilon_0) \) is given in (4.67). Further
\[
\int_T |\Psi(s, z)|^2 ds \leq Ce^{-\alpha(\epsilon_0)|z|} ||\Psi||_{\mathcal{H}}^2, \quad |z| \geq z_0.
\]

**Proof.** For any \( \epsilon_0 \), choose \( \lambda_0 = \lambda_0(\epsilon_0) > 0 \), \( z_0 = z_0(\epsilon_0) > 0 \), such that for for \( \lambda \leq \lambda_0 \)
\[
p(s, z) < 1 - 2\epsilon_0, \quad |z| \geq z_0, \quad (s, z) \in \mathcal{T}_\lambda.
\]
This is possible since \( |p(s, z) - \sigma(m(z))| \leq C\lambda, \lim_{|z| \to \infty} \sigma(m(z)) = \sigma(m_\beta) \) and \( 1 - 2\epsilon_0 < \sigma(m_\beta) \). Further \( \nu > 1 - \epsilon_0 \), hence, by (4.62), we have for \( |z| \geq z_0 \),
\[
\frac{1}{\nu^2} < \frac{1 - 2\epsilon_0}{1 - \epsilon_0}.
\]
Take \( \lambda_0 = \lambda_0(\epsilon_0) \) small enough so that \( 2z_0 \in \mathcal{T}_\lambda \). Take \( z = z_0 + n \) where \( n \) is any integer so that \( z_0 + 2n \in \mathcal{T}_\lambda \). By the eigenvalue equation we have
\[
\Psi(s, z_0 + n) = \frac{1}{\nu^2} (\mathcal{P}\Psi)(s, z_0 + n).
\]
Iterating \( n \) times (4.64) and by (4.63) we obtain
\[
|\Psi(s, z_0 + n)| \leq \left( \frac{1 - 2\epsilon_0}{1 - \epsilon_0} \right)^n |(J^n)\Psi(s, z_0 + n)| \leq \left( \frac{1 - 2\epsilon_0}{1 - \epsilon_0} \right)^n \|J^n\Psi\|_{\mathcal{H}}.
\]
By Proposition 4.9 we have that
\[
\|J^n\|_{\mathcal{H}} \leq \|J\|_{\mathcal{H}} \|J^\nu\|_{\mathcal{H}} \leq \left( \frac{1}{\sqrt{\lambda}} C \right) \|J\|_{\mathcal{H}} \|J\|_{\mathcal{H}} \|J\|_{\mathcal{H}} \leq \frac{1}{\sqrt{\lambda}} C(1 + C\lambda^2)^{n-1}\|J\|_{\mathcal{H}} \|\Psi\|_{\mathcal{H}},
\]
where \( |\Gamma^n(z)| \leq C\lambda^2 \). Hence, by Jensen inequality we get
\[
\|J^n\Psi\|_{\mathcal{H}} \leq \|J^n\|_{\mathcal{H}} \|\Psi\|_{\mathcal{H}} \leq \frac{1}{\sqrt{\lambda}} C|J|_{\mathcal{H}} \|J\|_{\mathcal{H}} |J^n|_{\mathcal{H}} \|\Psi\|_{\mathcal{H}} \leq \frac{1}{\sqrt{\lambda}} C(1 + C\lambda^2)^{n-1}\|J\|_{\mathcal{H}} \|\Psi\|_{\mathcal{H}},
\]
where we estimated \( \|J^c\|_2 \leq \frac{C}{\sqrt{\lambda}} \|J\|_2 \). Take \( \lambda \) small enough so that \( \frac{1}{2} \ln \left( \frac{1-\epsilon_0}{1-2\epsilon_0} \right) \geq \ln(1 + C\lambda^2) \). Hence, by (4.65), we have

\[
|\Psi(s, z_0 + n)| \leq \frac{1}{\sqrt{\lambda}} Ce^{-\alpha(\epsilon_0)} \|J\|_2 \|\Psi\|_H, \tag{4.66}
\]

where

\[
\alpha(\epsilon_0) = \frac{1}{2} \ln \left( \frac{1-\epsilon_0}{1-2\epsilon_0} \right) > 0. \tag{4.67}
\]

To get (4.61) we proceed as above obtaining

\[
\int_T ds|\Psi(s, z_0 + n)|^2 \leq \left( \frac{1-2\epsilon_0}{1-\epsilon_0} \right)^{2n} \int_T ds|(J^c)^n\Psi(s, z_0 + n)|^2. \tag{4.68}
\]

By Proposition 4.9 we have that

\[
\int_T ds'J^c(s, s', z, z') = \tilde{J}(z - z') + \Gamma_1^s(z, z')
\]

where \( |\Gamma_1^s(z, z')| \leq C\lambda_2 \tilde{J}(z - z') \). Set \( \tilde{z} = z_0 + n \), by Jensen inequality we have

\[
\int_T ds|(J^c)^n\Psi(s, z_0 + n)|^2 = \int_T ds \left( \int_{\mathcal{T}_x} ds' dz'J^c(s, s', \tilde{z}, z') \right)^2 \leq (1 + C\lambda^2) \int_T ds' dz' \left( \int_T ds' dz' J^c(s, s', \tilde{z}, z') \right)^2 \leq (1 + C\lambda^2) \int_T ds' dz' \left( (J^c)^{n-1}\Psi(s', z') \right)^2 \leq (1 + 2C\lambda^2) \sup_z \tilde{J}(z) \int_{\mathcal{T}_x} ds' dz' \left( (J^c)^{n-1}\Psi(s', z') \right)^2 \leq (1 + 2C\lambda^2)^n \sup_z \tilde{J}(z) \|\Psi\|_H^2 \leq C(1 + 2C\lambda^2)^n \|\Psi\|_H^2.
\]

Therefore by (4.68), (4.69) and (4.67)

\[
\int_T ds|\Psi(s, z_0 + n)|^2 \leq C \left( \frac{1-2\epsilon_0}{1-\epsilon_0} \right)^{2n} (1 + 2C\lambda^2)^n \|\Psi\|_H^2 \leq Ce^{-4\alpha(\epsilon_0)}e^{n\ln(1+2\lambda^2)}\|\Psi\|_H^2. \tag{4.70}
\]

Take \( \lambda \) small enough so that \( 3\alpha(\epsilon_0) \geq \ln(1 + 2C\lambda^2) \), we then obtain (4.61).

\[
\square
\]

**Proof of Theorem 4.7** The points (0), (1) and (2) are an immediate consequence of Theorem 4.10. Namely, let \( T : \mathcal{H} \to L^2(\mathcal{T}_x) \) so that \( TV = \sqrt{\nu} \). The map \( T \) is an isometry and the operator \( I - \mathcal{P} : \mathcal{H} \to \mathcal{H} \) is therefore conjugate to the operator \( A : L^2(\mathcal{T}_x) \to L^2(\mathcal{T}_x) \). This means that the spectrum of the two operators are equal, moreover if \( V \) is an eigenfunction of \( \mathcal{P} \), then \( TV \) is an eigenfunction of \( A \). Next we show the upper bound in (4.47). By the variational form for the eigenvalues

\[
\mu_0 = \inf_{V \in L^2(\mathcal{T}_x), \|V\|_1 = 1} \langle AV, V \rangle \leq \langle A\tilde{V}, \tilde{V} \rangle,
\]

where \( \tilde{V} = \frac{m^*(z)}{|m^*|^2(\mathcal{T}_x)} \). Since \( \tilde{V} \) is a function of only the \( z \)-variable, by Proposition 4.9,

\[
AV = \mathcal{L}^* \tilde{V} + \Gamma^* \tilde{V}.
\]

Hence

\[
\mu_0 \leq \langle A\tilde{V}, \tilde{V} \rangle = \int_T ds \langle \tilde{V}(s, \cdot), \mathcal{L}^* \tilde{V}(s, \cdot) \rangle_s + \int_T ds \langle \tilde{V}(s, \cdot), \Gamma^* \tilde{V}(s, \cdot) \rangle_s.
\]
By (3.29)
\[ \int_{T} ds \langle \hat{V}(s, \cdot), L^* \hat{V}(s, \cdot) \rangle_{s} \leq C \lambda^2, \]
and by (4.51)
\[ \int_{T} ds \langle \hat{V}(s, \cdot), \Gamma^* \hat{V}(s, \cdot) \rangle_{s} \leq C \lambda^2. \]
Therefore
\[ \mu_0 \leq C \lambda^2. \quad (4.71) \]

Let \( \Phi_0 \) be the normalized positive eigenfunction associated to \( \mu_0 \). Multiply the eigenvalue equation by \( \Psi_1 \), see (3.11) the principal eigenvalue of \( L^* \), defined in (3.8). We have, since \( A \) is self-adjoint
\[ \mu_0 \langle \Phi_0, \Psi_1 \rangle = \langle A \Phi_0, \Psi_1 \rangle = \langle \Phi_0, A \Psi_1 \rangle. \]

By Taylor formula \( \Psi_1(s', z) = \Psi_1(s, z) + (s - s') \nabla_s \Psi_1(\tilde{s}, z) \), where \( \tilde{s} \in (s, s') \). By Proposition 4.9
\[ A \Psi_1 = \frac{\Psi_1}{\sigma(m_A)} - \int_{T_{s}} J^c(s, s', z, z') \Psi_1(s', z') ds' dz' \]
\[ = \frac{\Psi_1}{\sigma(m_A)} - \int_{T_{s}} J^c(s, s', z, z') \Psi_1(s, z') ds' dz' - \int_{T_{s}} J^c(s, s', z, z')(s - s') \nabla_s \Psi_1(\tilde{s}, z') ds' dz' \quad (4.72) \]
\[ = (L^* \Psi_1)(s, z) + \Gamma^s \Psi_1 - \int_{T_{s}} J^c(s, s', z, z')(s - s') \nabla_s \Psi_1(\tilde{s}, z') ds' dz'. \]

Therefore
\[ \mu_0 \langle \Phi_0, \Psi_1 \rangle = \langle \Phi_0, L^* \Psi_1 \rangle + \langle \Phi_0, \Gamma^s \Psi_1 \rangle + \int_{T_{s}} ds dz \Phi_0(s, z) \int_{T_{s}} J^c(s, s', z, z')(s - s') \nabla_s \Psi_1(\tilde{s}, z') ds' dz'. \quad (4.73) \]

By (3.17) and (2.15) we estimate
\[ \left| \int_{T_{s}} ds dz \Phi_0(s, z) \int_{T_{s}} J^c(s, s', z, z')(s - s') \nabla_s \Psi_1(\tilde{s}, z') ds' dz' \right| \leq C \lambda \left\| \Phi_0 \right\| \left\| \nabla_s \Psi_1 \right\| \leq C \lambda \left\| \nabla_s m_A \right\| \leq C \lambda^2, \]
\[ \langle \Phi_0, \Gamma^s \Psi_1 \rangle \leq C \lambda^2. \]
Therefore, we have
\[ \mu_0 \langle \Phi_0, \Psi_1 \rangle \geq \inf_s \mu_1^s \langle \Phi_0, \Psi_1 \rangle - C \lambda^2. \]

We need to show that
\[ \langle \Phi_0, \Psi_1 \rangle \geq C. \quad (4.74) \]

By (3.15) and (4.46) there exist \( z_1 > 0 \) and \( \zeta_1 > 0 \) independent on \( \lambda \) so that \( \Phi_0(s, z) \Psi_1(s, z) \geq \zeta_1 \) for \( |z| \leq z_1 \) and for all \( s \in T \). Therefore (4.74) holds and we obtain
\[ \mu_0 \geq -C \lambda^2. \]
4.4. Proof of Theorem 2.4. As explained in the introduction, we would like to take advantage of (2.17), splitting the quadratic form associated to the operator $A_{m_A}^\lambda$ into two integrals. One integral is over the region $\Omega \setminus \mathcal{N}(\frac{d_0}{2})$ and because of (2.17) is positive. The second integral is over the region $\mathcal{N}(\frac{d_0}{2})$, i.e., near the surface $\Gamma$ and we can estimate it from below by applying Lemma 4.2 and Lemma 4.8. But because of the non-locality of the operator this argument does not work. Namely, when splitting the integral of the quadratic form there is an extra term which might spoil the estimate. Here, we show that it is always possible to find a way to split the integral of the quadratic form associated to the operator $A_{m_A}^\lambda$ to obtain the desired estimate.

Define for any integer $k \in \{0, \ldots, N\}$, for $N = \lfloor \frac{x}{\delta} \rfloor$ where for $x \in \mathbb{R}$, $[x]$ is the integer part of $x$, a sequence of cut-off functions

$$\eta_k^k(\xi) = \begin{cases} 1 & \text{when } \xi \in \mathcal{N}(\frac{d_0}{2}(1 + \lambda k)) \\ 0 & \text{otherwise}, \end{cases}$$

$$\eta_k^1(\xi) = 1 - \eta_k^k(\xi)$$

and set

$$s_k = 2 \int_{\Omega} \xi \eta_k^k(\xi) v(\xi) (J^\lambda \ast \eta_k^k v)(\xi).$$

Let $k = 0$. We have, taking into account that $\eta_0^0(\xi) \eta_0^1(\xi) = 0$ for $\xi \in \Omega$ and the symmetry of $J^\lambda(\cdot)$

$$\int_{\Omega} (A_{m_A}^\lambda v)(\xi) v(\xi) d\xi = \int_{\Omega} (A_{m_A}^\lambda v)(\xi) \eta_0^1(\xi) v(\xi) d\xi + \int_{\Omega} (A_{m_A}^\lambda \eta_0^1 v)(\xi) \eta_0^1(\xi) v(\xi) d\xi - s_0$$

(4.76)

Because of (2.17)

$$\int_{\Omega} (A_{m_A}^\lambda \eta_0^1 v)(\xi) \eta_0^1(\xi) v(\xi) d\xi \geq (C^\ast - 1) \|\eta_0^1 v\|_{L^2(\Omega)}^2 > 0.$$  

By Lemma 4.2 and Lemma 4.8 we have that

$$\int_{\Omega} (A_{m_A}^\lambda \eta_0^1 v)(\xi) \eta_0^1(\xi) v(\xi) d\xi \geq -C\lambda^2 \|v\|_{L^2(\Omega)}^2.$$  

But the last term of (4.76) might create problems. Obviously if

$$s_0 < 0$$

(4.77)

or if

$$s_0 \leq \delta^* \|\eta_0^0 v\|_{L^2(\Omega)}^2$$

(4.78)

for $\delta^* > 0$ so that $(C^\ast - 1 - \delta^*) > 0$ or if

$$s_0 \leq C\lambda^2 \|v\|_{L^2(\Omega)}^2$$

(4.79)

then the theorem would be proven. But this might not be the case. We proceed recursively as following. Assume that no one of the three conditions (4.77), (4.78), (4.79) hold. Take $\delta > 0$ so that $2\frac{\delta}{1 - \delta} \leq \delta^*$ Notice that since we are assuming that (4.77) does not hold, $s_0 > 0$. We must have

$$s_0 > \delta \left[ s_0 + 2\|\eta_0^0 v\|_{L^2(\Omega)}^2 \right].$$

(4.80)

Namely, if the reverse inequality holds in (4.80) then

$$s_0 \leq 2\frac{\delta}{1 - \delta} \|\eta_0^0 v\|_{L^2(\Omega)}^2 \leq \delta^* \|\eta_0^0 v\|_{L^2(\Omega)}^2,$$

(4.81)

which is (4.78). But we are assuming that (4.78) does not hold. Notice that the integral defining $s_0$ has support in a stripe of width $2\lambda$ around $\Gamma_{\pm \frac{d_0}{2}} = \{ \xi \in \Omega : r(\xi, \Gamma) = \pm \frac{d_0}{2} \}$. So we might try to split
the integral of the quadratic form moving by \( \lambda \) from \( \Gamma_{s,\pm\frac{s}{2}} \), i.e. applying the cut off function \( \eta_1^s \). If one of the following conditions holds

\[
\begin{align*}
    s_1 &\leq 0, \\
    s_1 &\leq \delta^* \| \eta_2^0 v \|^2_{L^2(\Omega)}, \\
    s_1 &\leq \lambda^2 \| v \|^2_{L^2(\Omega)},
\end{align*}
\]

we can conclude the proof of the theorem. If not then

\[
s_1 > \delta \left[ s_1 + 2 \| \eta_2^0 v \|^2_{L^2(\Omega)} \right].
\]

By (4.80),

\[
s_1 = \sum_{i=0}^{1} s_i - s_0 \leq \sum_{i=0}^{1} s_i - \delta \left[ s_0 + 2 \| \eta_2^0 v \|^2_{L^2(\Omega)} \right].
\]

Notice that

\[
s_1 = 2 \int_\Omega d\xi \eta_1^s(\xi)v(\xi)(J^\lambda * \eta_2^0 v)(\xi) \leq 2 \int_\Omega d\xi \eta_2^0(\xi)|v(\xi)||J^\lambda * \eta_2^0 v(\xi)| \leq 2 \| \eta_2^0 v \|^2_{L^2(\Omega)}.
\]

Therefore

\[
s_1 \leq (1 - \delta) \sum_{i=0}^{1} s_i.
\]

Next we show that there exists \( \tilde{k} \in \{0, \ldots, N\} \) so that if for \( j \in \{0, \ldots, \tilde{k} - 1\} \) no one of the following conditions is satisfied

\[
\begin{align*}
    s_j &\leq 0, \\
    s_j &\leq \delta^* \| \eta_2^0 v \|^2_{L^2(\Omega)}, \\
    s_j &\leq \lambda^2 \| v \|^2_{L^2(\Omega)}
\end{align*}
\]

then

\[
s_{\tilde{k}} \leq \lambda^2 \| v \|^2_{L^2(\Omega)}.
\]

Namely, reiterating the argument done in the case of \( s_1 \) we have that for \( k \in \{0, \ldots, N\} \)

\[
s_k \leq (1 - \delta)^k \sum_{i=0}^{k} s_i.
\]

Denote \( \delta_0 = -\log(1 - \delta) > 0 \). Take \( \lambda \) small enough so that \( \frac{1}{\delta_0} \log \frac{1}{\lambda} < \left[ \frac{k}{k} \right] = N \) and set \( \tilde{k} = \left[ \frac{1}{\delta_0} \log \frac{1}{\lambda} \right] \).

With such a choice \( \tilde{k} < N \). We have

\[
\begin{align*}
    s_{\tilde{k}} &\leq e^{-\delta_0 \tilde{k}} \sum_{i=0}^{\tilde{k}} s_i, \\
    &\leq \lambda^2 \sum_{i=0}^{\tilde{k}} s_i \leq C \lambda^2 \| v \|^2_{L^2(\Omega)}.
\end{align*}
\]

We then split

\[
\begin{align*}
    \int_\Omega (A_{mA}^\lambda v)(\xi)v(\xi)d\xi &= \int_\Omega (A_{mA}^\lambda \eta_1^s v)(\xi)\eta_1^s(\xi)v(\xi)d\xi \\
    &+ \int_\Omega (A_{mA}^\lambda \eta_2^s v)(\xi)\eta_2^s(\xi)v(\xi)d\xi - s_{\tilde{k}}.
\end{align*}
\]

Because of (2.17)

\[
\int_\Omega (A_{mA}^\lambda \eta_2^s v)(\xi)\eta_2^s(\xi)v(\xi)d\xi \geq (C^* - 1) \| \eta_2^s v \|^2_{L^2(\Omega)} > 0.
\]
By Lemma 4.2 and Lemma 4.8 we have that
\[ \int_{\Omega} (A^\lambda_{m_A} \eta^k_\ell v)(\xi)\eta^k_\ell v(\xi)d\xi \geq -C\lambda^2\|v\|^2_{L^2(\Omega)}, \]
and
\[ s_k \leq C\lambda^2\|v\|^2_{L^2(\Omega)}. \]
Theorem is proved.

5. Two dimensional convolution operators in enlarged bounded domains.

Essential ingredient to show the $H^{-1}$- estimate, stated in Theorem 2.5, is the knowledge of the spectrum of the operator defined below, see (5.1). For $V \in L^2(\mathcal{T}_\lambda)$, where $\mathcal{T}_\lambda$ is the the enlarged cylinder defined in (4.40), denote
\[ (G^\lambda V)(s, z) = \frac{V(s, z)}{\sigma(\bar{m}(z))} - \int_{\mathcal{T}_\lambda} \frac{1}{\lambda} J\left(\frac{s - s'}{\lambda}, z - z'\right) V(s', z')dz'ds', \]
where $J$ is the symmetric probability density on $\mathbb{R}^2$ defined in Subsection 2.1. We study the spectrum of the operator $G^\lambda$ on $L^2(\mathcal{T}_\lambda)$ by Fourier analysis. For $h \in \mathbb{R}$, let $J^h(\cdot)$ be the $h$ component of the Fourier transform of $J(s, \cdot)$, $s \in \mathbb{R}$:
\[ J^h(z) = \int_\mathbb{R} J(s, z)e^{ith}ds = \int_\mathbb{R} J(s, z)\cos(hs)ds. \]
The last identity holds because $J$ is an even function of $s$. This implies that $J^h = J^{-h}$. Since $J \in C^1(\mathbb{R}^2)$ we have that
\[ |J^h(z)| \leq \frac{C(z)}{1 + |h|}, \]
where $C(z) = 0$ when $|z| > 1$ and
\[ C(z) = \int ds |\frac{d}{ds} J(s, z)|, \quad \text{for } |z| \leq 1. \]
Further
\[ J^0(z) = \int J(s, z)ds = \bar{J}(z), \]
see Subsection 2.1. For $w \in L^2(I_\lambda)$ denote
\[ (L^h w)(z) = \left[ \frac{w(z)}{\sigma(\bar{m}(z))} - (J^h \ast I_\lambda w)(z) \right]. \]

**Proposition 5.1.** The operator $L^h$, $h \in \mathbb{R}$, is a bounded, self-adjoint operator on $L^2(I_\lambda)$. The spectrum of $L^h$ is discrete.

**Proof.** The proof is straightforward. One needs to exploit that $\mathcal{P}^h w = \sigma(\bar{m})J^h \ast w$ is a bounded integral operator in $L^2(I_\lambda)$ and that $L^h$ is conjugate to $I - \mathcal{P}^h$. \(\square\)

By general arguments one can deduce informations about the spectrum of $G^\lambda$ by the knowledge of the spectrum of $L^h$. Any $V \in L^2(\mathcal{T}_\lambda)$ can be expanded in Fourier complex series as the following
\[ V(s, z) = \sum_{k \in \mathbb{Z}_L} c_{ik}u_k(z) \]
where $\mathbb{Z}_L = \frac{2\pi}{T}\mathbb{Z}$ and $u_k(z) = \frac{1}{T} \int_T V(s, z)e^{-ikt}ds$. Let $\mathcal{F} : L^2(\mathcal{T}_\lambda) \to \bigoplus_{k \in \mathbb{Z}_L} H_k$, $H_k = L^2(I_\lambda)$, be the isometry induced by the Fourier expansion. We denote by $W = (u_k)_{k \in \mathbb{Z}_L}$ an element of $\bigoplus_{k \in \mathbb{Z}_L} H_k$. 
Theorem 5.2. Let $\sigma(G^\lambda)$ be the spectrum of $G^\lambda$ in $L^2(T_{\lambda})$ and $\sigma(L^h)$ the spectrum of $L^h$ in $L^2(I_{\lambda})$. Then

$$\sigma(G^\lambda) = \bigcup_{k \in \mathbb{Z}_L} \sigma(L^{\lambda k}).$$

Proof. Let $\tilde{G}^\lambda = \bigoplus_{k \in \mathbb{Z}_L} L^{\lambda k}$ be the operator defined on $\bigoplus_{k \in \mathbb{Z}_L} H_k$ so that $\tilde{G}^\lambda W = (L^{\lambda k} u_k)_{k \in \mathbb{Z}_L}$. We have that

$$G^\lambda = F^{-1} \tilde{G}^\lambda F.$$

Being conjugate $\tilde{G}^\lambda$ and $G^\lambda$ have the same spectrum. By [9], $\sigma(\tilde{G}^\lambda) = \bigcup_{k \in \mathbb{Z}_L} \sigma(L^{\lambda k})$. The thesis of theorem follows.

The aim is then to study the spectrum of $L^h$, $h \in R$. It turns out that when $|h| > h_0$, where $h_0$ is a positive real number, conveniently chosen, the spectrum of $L^h$ is strictly positive and can be lower bounded by a positive constant depending on $h_0$ but not on $h$. For $|h| \leq h_0$ the spectrum of $L^h$ is still positive but the lower bound does depend on $h$. In this case, we are able to give upper and lower bound of the principal eigenvalue of $L^h$ which turns out to be very useful. We analyse these type of behaviour in Proposition 5.6 and Proposition 5.7. Next, we show that eigenfunctions associated to small eigenvalues decay exponentially for $|z|$ large enough. This result is valid for all $\{L^h\}_h$.

Proposition 5.3. For any $\epsilon_0 \in (0, (1-\alpha(\epsilon_0))_2]$, there exists $z_0 > 0$, $\lambda_0 = \lambda_0(\epsilon_0)$ and $\alpha(\epsilon_0) > 0$ so that for $\lambda \leq \lambda_0$ the following holds. Let $\mu \leq 2\pi$ be an eigenvalue of $L^h$ and $\psi$ be any of the corresponding eigenfunctions. There is $\alpha(\epsilon_0) > 0$ and $z_0 = z_0(\epsilon_0)$ independent on $h$ and $\lambda$ so that

$$|\psi(z)| \leq C e^{-\alpha(\epsilon_0)|z|} \quad |z| \geq z_0. \quad (5.8)$$

The proof is similar to the one given in [14][ Lemma 3.5] and it is therefore omitted.

Remark 5.4. Notice that $z_0$ and $\alpha(\epsilon_0)$ depend only on $\epsilon_0$ and not on $h$. Applying the argument as in [14][ Lemma 3.5] one ends up with $|\psi(z)| \leq \beta \|J^h\|_2 e^{-\alpha(\epsilon_0)|z|}$. But it is immediate to see that $\|J^h\|_2 \leq \|J^0\|_2$.

The spectrum of the operator $L^0$, i.e. when $h = 0$ has been studied in [14]. When $|h| \leq \frac{\pi}{2}$ the integral kernel $J^h$ is positivity improving, i.e if $v(z) \geq 0$ and $v(z) \neq 0$ for $z \in I_{\lambda}$, then $\int_{I_{\lambda}} d\xi J^h(z - \xi)v(\xi) > 0$. Hence we could apply the same type of arguments used in [14] to study the spectrum of the operator $L^0$ when $|h| \leq \frac{\pi}{2}$. In Proposition 5.6 we summarise the results for the spectrum of $L^h$, $|h| \leq h_0$, where $h_0 \leq \frac{\pi}{2}$ is suitable chosen. To prove a uniform (in $|h| \leq h_0$ and $\lambda > 0$) lower bound for the gap of $L^h$ we apply perturbation theory.

Proposition 5.5. Let $J^h$, $|h| \leq \frac{\pi}{2}$, be the integral kernel defined in (5.2). We have that there exists $h_0 > 0$ so that for $|h| \leq h_0$,

$$\tilde{J}(z) - \frac{1}{2} h^2 \tilde{J}_{tan}(z) \leq J^h(z) \leq \tilde{J}(z) - \frac{1}{4} h^2 \tilde{J}_{tan}(z), \quad (5.9)$$

where $\tilde{J}_{tan}(\cdot)$ is defined in (5.10),

$$0 \leq \tilde{J}_{tan}(z) < \tilde{J}(z). \quad (5.10)$$

Proof. By Taylor expanding $\cos h\xi$ we have

$$1 - \frac{1}{2} h^2 \xi^2 + \frac{1}{4!} h^4 \geq \cos h\xi \geq 1 - \frac{1}{2} h^2 \xi^2.$$

Denote

$$\tilde{J}_{tan}(z) = \int J(\xi, z)\xi^2 d\xi. \quad (5.10)$$

We have

$$\tilde{J}(z) - \frac{1}{2} h^2 \tilde{J}_{tan}(z) + \frac{1}{4!} h^4 \int J(\xi, z)\xi^4 d\xi \geq J^h(z) \geq \tilde{J}(z) - \frac{1}{2} h^2 \tilde{J}_{tan}(z).$$
Since
\[ \int J(\xi, z)\xi^4 d\xi \leq \bar{J}_{tan}(z) \]
taking \( h_0 > 0 \) so that when \( |h| \leq h_0, \frac{1}{4}h^2 \leq \frac{1}{4} \) we obtain
\[ \bar{J}(z) - \frac{1}{2}h^2\bar{J}_{tan}(z) \leq J^h(z) \leq \bar{J}(z) - \frac{1}{4}h^2\bar{J}_{tan}(z). \]
Therefore we get (5.9).

**Proposition 5.6.** There exists \( h_0 \in (0, \frac{\pi}{2}) \) so that for \( |h| \leq h_0 \), the following holds for \( \mathcal{L}^h \) defined in (5.6) on \( L^2(I_\lambda) \).

1. There exists \( \mu_0^h \in \mathbb{R} \) and \( \psi_0^h \) strictly positive in \( I_\lambda \), \( \psi_0^h \) even function, so that
\[ \mathcal{L}^h\psi_0^h = \mu_0^h\psi_0^h. \]
The eigenvalue \( \mu_0^h \) has multiplicity one and any other eigenvalue is strictly bigger that \( \mu_0^h \).

2. Let \( \mu_0^0 \) be the principal eigenvalue of the operator \( \mathcal{L}^0 \). We have that
\[ \mu_0^0 < \mu_0^h \leq \mu_0^0 + \frac{1}{2}h^2. \]

3. There exists \( D > 0 \) independent on \( \lambda \) and \( h \) so that
\[ \inf_{\|\psi\|=1, \langle \psi, \psi_0^h \rangle = 0} \langle \mathcal{L}^h\psi, \psi \rangle \geq D, \quad \forall h: |h| \leq h_0. \quad (5.11) \]

4. The principal eigenvector \( \psi_0^h \) is such that
\[ \|\psi_0^h - \psi_0^0\|^2 \leq Ch^2. \quad (5.12) \]

5. There exists \( z_0 > 0 \) and \( \zeta_0 > 0 \) independent on \( h \) and \( \lambda \) so that
\[ \psi_0^h(z) \geq \zeta_0, \quad |z| \leq z_0. \]

6. There exists \( C_0 > 0 \), independent on \( \lambda \) and \( h \), so that
\[ \mu_0^h \geq \mu_0^0 + C_0h^2. \quad (5.13) \]

**Proof.** For \( |h| \leq \frac{\pi}{2} \), for \( |s| \leq 1 \), the integral kernel \( J^h \), in the definition of \( \mathcal{L}^h \), is non negative for \( z \in I_\lambda \). Applying the Perron Frobenius Theorem to the operator \( (\mathcal{A}^h_\mu)g(z) = \sigma(\bar{m})(J^h \ast g)(z), z \in I_\lambda \) and proceeding as in [14] [Theorem 2.1] we prove point (1). To show (2) and (3) we apply standard perturbation theory for bounded selfadjoint operators, see [12]. Define the following family of operators indexed by \( \nu \):
\[ A_\nu = \mathcal{L}^0 + \nu B, \quad \nu \in [0, 1] \]
where
\[ B = \mathcal{L}^h - \mathcal{L}^0. \]
The family \( A_\nu \) connects in a smooth way the unperturbed operator \( \mathcal{L}^0 \) to \( \mathcal{L}^h \). We have that
\[ Bw(z) = [\mathcal{L}^h - \mathcal{L}^0]w(z) = \int J(\xi, z - z')[1 - \cos(h\xi)]d\xi w(z')dz'. \]
Notice that for \( |h| \leq h_0 \), \( B \) leaves invariant the cone of the positive functions. Further, by (5.9),
\[ \|B\| = \sup_{\|w\|=1} \langle w, [\mathcal{L}^h - \mathcal{L}^0]w \rangle \leq \frac{1}{2}h^2. \quad (5.14) \]
Since \( \mathcal{L}^0 \) has an isolated simple eigenvalue and a spectral gap \( D \), independent on \( \lambda \), see Theorem 3.1, the \( \mathcal{L}^h \) for all
\[ |h| \leq \sqrt{\frac{D}{3}} = h_0 \]
will have an isolated simple eigenvalue and a spectral gap bigger or equal of $D/4$. Moreover the principal eigenvalue $\mu_0^\nu$ and eigenvector $\psi_0^\nu$ of $A_\nu$ are analytic in $\nu$. By Perron Frobenius Theorem $\psi_0^\nu > 0$ and we assume $\langle \psi_0^\nu, \psi_0^\nu \rangle = 1$. Next we would like to show that that $\mu_h^\nu > \mu_0^\nu$. We derive with respect to $\nu$ the eigenvalue equation

$$A_\nu \psi_0^\nu = \mu_0^\nu \psi_0^\nu.$$  

We have

$$B \psi_0^\nu + A_\nu \tilde{c}_\nu (\psi_0^\nu) = \tilde{c}_\nu (\mu_0^\nu) \psi_0^\nu + \mu_0^\nu \tilde{c}_\nu (\psi_0^\nu),$$

$$\langle \psi_0^\nu, [B \psi_0^\nu + A_\nu \tilde{c}_\nu (\psi_0^\nu)] \rangle = \langle \psi_0^\nu, [\tilde{c}_\nu (\mu_0^\nu) \psi_0^\nu + \mu_0^\nu \tilde{c}_\nu (\psi_0^\nu)] \rangle.$$  

Therefore

$$\langle \psi_0^\nu, B \psi_0^\nu \rangle + \mu_0^\nu \langle \psi_0^\nu, \tilde{c}_\nu (\psi_0^\nu) \rangle = \tilde{c}_\nu (\mu_0^\nu) \langle \psi_0^\nu, \psi_0^\nu \rangle + \mu_0^\nu \langle \psi_0^\nu, \tilde{c}_\nu (\psi_0^\nu) \rangle.$$  

We have

$$\langle \psi_0^\nu, B \psi_0^\nu \rangle = \tilde{c}_\nu (\mu_0^\nu).$$  

Hence

$$\mu_0^\nu = \mu_0^0 + \int_0^\nu \langle \psi_0^\nu, B \psi_0^\nu \rangle d\nu'.$$  

(5.15)

Since $\psi_0^\nu > 0$ and $B$ is a positive operator $\mu_0^\nu > \mu_0^0$. By (5.14),

$$\mu_0^\nu \leq \mu_0^0 + \frac{1}{2} h^2.$$  

When $\nu = 1$, $A_{(\nu=1)} = L^h$, $\mu_0^1 = \mu_0^h$ and we have

$$\mu_0^h \leq \mu_0^0 + \frac{1}{2} h^2.$$  

Next we show (5.12). For $h \neq 0$, split

$$\psi_0^0 = a \psi_0^h + (\psi_0^h)^\perp.$$  

(5.16)

Then

$$a^2 + \| (\psi_0^h)^\perp \|^2 = 1$$  

(5.17)

$$\langle L^h \psi_0^0, \psi_0^0 \rangle = a^2 \mu_0^h + \langle L^h (\psi_0^h)^\perp, (\psi_0^h)^\perp \rangle \geq a^2 \mu_0^h + \frac{D}{4} \| (\psi_0^h)^\perp \|^2.$$  

(5.18)

Further

$$\langle L^h \psi_0^0, \psi_0^0 \rangle = \langle L^0 \psi_0^0, \psi_0^0 \rangle + \langle (L^h - L^0) \psi_0^0, \psi_0^0 \rangle$$

$$\leq \mu_0^0 + \frac{1}{2} h^2.$$  

(5.19)

By (5.17), (5.18) and $\mu_0^0 > 0$ we have that

$$\mu_0^0 + \frac{1}{2} h^2 \geq a^2 \mu_0^0 + \frac{D}{4} \| (\psi_0^h)^\perp \|^2 \geq \frac{D}{4} \| (\psi_0^h)^\perp \|^2.$$  

By [14] [Theorem 2.2, formula (2.8)], $0 \leq \mu_0^0 \leq C e^{-2\alpha}$. It follows that there exists $C > 0$ independent on $\lambda$ and $h$ so that

$$\| (\psi_0^h)^\perp \|^2 \leq Ch^2.$$  

(5.20)

By (5.17) $a^2 = 1 - \| (\psi_0^h)^\perp \|^2$. This, together with decomposition (5.16) and (5.20) implies (5.12).

The proof of the point (5) can be done as in [14] [Lemma 3.6, formula (3.22)]. The proof is similar to the one given in Theorem 3.2 when proving (3.15).

To show (6) we need to lower bound, see (5.15), $\int_0^\nu \langle \psi_0^0, B \psi_0^0 \rangle d\nu'$. First of all we note that the same type of argument of point (5) applies to $\psi_0^0$ the principal eigenvalue of $A_\nu$. Namely $\psi_0^0(z), z \in I_\lambda,$ is positive and exponentially decaying when $|z|$ large enough. Hence, as in point (5), there exists $z_0 > 0$ and $\zeta_0 > 0$ so that

$$\psi_0^0(z) \geq \zeta_0, \quad |z| \leq z_0, \quad \forall \nu \in [0, 1].$$  

(5.21)
Proposition 5.8. Let \( \nu \) be independent on \( \lambda \) in (5.3) so that for \( h \) and \( \lambda \) so that for \( |h| > h_0 \)
\[
\langle w, \mathcal{L}^h w \rangle \geq \nu \|w\|^2.
\] (5.23)

The proof of Proposition 5.7 follows from Proposition 5.8 and Proposition 5.9.

Proposition 5.9. Let \( \mathcal{L}^h \) be the operator defined in (5.6) over functions \( L^2(I_\lambda) \). For any given \( h_0 > h_1 \), there exists \( \nu = \nu(h_0, h_1) > 0 \) so that for \( |h| \leq h_1 \)
\[
\langle w, \mathcal{L}^h w \rangle \geq \nu \|w\|^2.
\] (5.27)

Proof. We first show that there exists \( c_1 = c_1(h_0, h_1) > 0 \) so that
\[
|J^h(z)| \leq \tilde{J}(z)(1 - c_1), \quad h_0 \leq |h| \leq h_1, \quad z \in (-1, 1).
\] (5.28)

To show this we argue by contradiction. Assume that there exists \( \tilde{z} \in (-1, 1) \) and \( \tilde{h} \) so that \( |J^\tilde{h}(\tilde{z})| = \tilde{J}(\tilde{z}). \) Then \( J^\tilde{h}(\tilde{z}) = e^{i\theta} \tilde{J}(\tilde{z}) \) for some \( \theta \in \mathbb{R}, \) and therefore
\[
\tilde{J}(\tilde{z}) = e^{-i\theta} J^\tilde{h}(\tilde{z})
\]
which means
\[
\int_{\mathbb{R}} J(\xi, \tilde{z}) \left[ 1 - e^{-i\theta} e^{i\xi} \right] d\xi = 0.
\] (5.29)

This implies that the real part of (5.29), i.e
\[
\int_{\mathbb{R}} J(\xi, \tilde{z}) \left[ 1 - \cos(\theta - \tilde{h}\xi) \right] d\xi = 0.
\]
This forces \( J(\xi, \bar{z}) = 0 \) for all \( \xi \in \mathbb{R} \), which is a contradiction. Since for any given \( z \) the set \( \{ J^h(z), h_0 \leq |h| \leq h_1 \} \) is a compact subset of \( \mathbb{R} \), and \( |J^h(z)| < \bar{J}(z) \), then (5.28) follows. Hence, by definition of \( \mathcal{L}_h \) and (5.28), we get, for \( 1 > a > 0 \),
\[
\langle w, \mathcal{L}_h w \rangle = (1 - a) \int dz \frac{w^2(z)}{\sigma(\bar{m}(z))} + a \left[ \int dz \frac{w^2(z)}{\sigma(\bar{m}(z))} - \langle w | \bar{J} \star |w| \rangle \right] + a \langle |w| (\bar{J} \star |w|) - \langle w, J^h \star w \rangle. \tag{5.30}
\]
By (5.28),
\[
|\langle w, J^h \star w \rangle| \leq \langle |w|, |J^h| \star |w| \rangle \leq (1 - c_1) \langle |w|, \bar{J} \star |w| \rangle.
\]
Then, taking \( a = 1 - c_1 \) we have that
\[
a \langle |w|, \bar{J} \star |w| \rangle - \langle w, J^h \star w \rangle \geq 0.
\]
Further, since
\[
\inf_{\{w : |w| = 1\}} \langle |w|, \mathcal{L}_0 |w| \rangle \geq \inf_{\{w : |w| = 1\}} \langle w, \mathcal{L}_0 w \rangle \geq 0, \tag{5.31}
\]
and \( \sigma(\bar{m}(z)) \leq \beta \)
\[
\inf_{\{w : |w| = 1\}} \langle w, \mathcal{L}_h w \rangle \geq \frac{c_1}{\beta} \equiv \nu. \tag{5.32}
\]

6. Representation formula for functions with small energy.

In this section, we show a representation theorem for functions having small energy, see (6.1) below. The representation stated in Theorem 6.1 is reminiscent of the one obtained by X. Chen, see [7, Lemma 2.4] in the C-H case. The proof, as explained in the introduction, is different.

**Theorem 6.1.** Take \( f \in H^1(\mathcal{N}(d_0)) \) such that \( \|f\|_{L^2(\mathcal{N}(d_0))} = 1 \), and
\[
\int_{\mathcal{N}(d_0)} (A^{L^2}_{\lambda} \lambda^2 f(\xi)) f(\xi) d\xi \leq C \lambda^2. \tag{6.1}
\]
Then, there exists \( \lambda_0 > 0 \), so that for any \( \lambda \in (0, \lambda_0) \) we can construct \( Z(\cdot) \in H^1(T), f^R(\cdot, \cdot) \in L^2(\mathcal{N}(d_0)) \) such that
\[
\hat{f}(s, r) = Z(s) - \frac{1}{\sqrt{\alpha(s, r)}} \frac{1}{\sqrt{\lambda}} \psi_0^0(r) + f^R(s, r), \tag{6.2}
\]
where \( \psi_0^0(\cdot) \) is the first eigenvalue of \( \mathcal{L}_0 \), see Theorem 3.1,
\[
1 - C \lambda^2 \leq \|Z\|^2_{L^2(T)} \leq 1, \quad \|\nabla Z\|_{L^2(T)} \leq C \tag{6.3}
\]
\[
\|f^R\|^2_{L^2(\mathcal{N}(d_0))} \leq C \lambda^2. \tag{6.4}
\]

Set \( \hat{f}(s, r) = \sqrt{\alpha(s, r)} f(s, r) \). By Lemma 4.2, (6.1) implies
\[
C \lambda^2 \geq \int_{\mathcal{N}(d_0)} A^{L^2}_{\lambda} \lambda^2 f(\xi) f(\xi) d\xi \geq \langle \hat{f}, L^2 \hat{f} \rangle - \lambda^2 \|f\|^2_{L^2(\mathcal{N}(d_0))}. \tag{6.5}
\]
Since by assumption \( \|f\|^2_{L^2(\mathcal{N}(d_0))} = 1 \) we have
\[
\lambda^2 C \geq \langle \hat{f}, L^2 \hat{f} \rangle. \tag{6.6}
\]
Further setting
\[
\hat{f}(s, r) = \frac{1}{\sqrt{\lambda}} V(s, \frac{r}{\lambda})
\]
we have that (6.6) is equivalent to
\[
\lambda^2 C \geq \langle V, AV \rangle, \tag{6.7}
\]
where $A$ is the operator defined in (4.44) Therefore Theorem 6.1 follows once we show the following theorem.

**Theorem 6.2.** Take $V \in H^1(T_\lambda)$, $|V| = 1$,  
$$\langle V, AV \rangle \leq CL^2,$$  
where $A$ is the operator defined in (4.44). Let $\psi^0_\lambda(\cdot)$ be the first eigenvalue of $L^0$, see Theorem 3.1, we have  
$$V(s, z) = Z(s, z), \quad 1 - \lambda^2 \leq |Z|_{L^2(T)}^2 \leq 1, \quad \|\nabla Z\| \leq C, \quad \|V^R\|^2 \leq C\lambda^2. \quad (6.10)$$

The proof of Theorem 6.2 is based on a deeper knowledge of the spectrum of the operator $A$ in $L^2(T_\lambda)$. We explain in Subsection 6.1 how to prove (6.9) when the operator $A$ is replaced by the operator $G$ defined in (5.1). Then in Subsection 6.2 we write the operator $A$ in term of $G$ plus extra terms. In Subsection 6.3 we show Theorem 6.2.

6.1. **Toy model.** We explain the method for proving Theorem 6.2 in a simpler context. Replace the operator $A$ with the operator $G_\lambda$ defined in (5.1). Notice that $G_\lambda$ defined in (5.1) is different from the $A$ defined in (4.44). Namely $\tilde{m}$ replaces $m_A$ and the convolution term replaces $J^2$. Assume  
$$\langle V, G^2 V \rangle \leq CL^2. \quad (6.11)$$

We would like to prove that (6.9) and (6.10) follow. Write $V(s, z) = \sum_{k \in \mathbb{Z}_L} e^{i2\pi \frac{k}{L} s} u_k(z)$, see (5.7). By (6.11) and simple computations  
$$C\lambda^2 \geq \langle V, G^2 V \rangle = \sum_{k \in \mathbb{Z}_L} \langle L^{k\lambda} u_k, u_k \rangle. \quad (6.12)$$

We then apply the spectral results for $\{L^h\}_h$ obtained above. Let $h_0 > 0$ be as in Proposition 5.6. When $|k| \leq \frac{h_0}{\lambda}$ split  
$$u_k = \alpha_k \psi^k_0 + u^\perp_k,$$

where $\psi^k_0$ is the principal eigenvalue of $L^{k\lambda}$ and  
$$\int dz \psi^k_0(z) u^\perp_k(z) = 0.$$

By Proposition 5.6 and Proposition 5.7 we have  
$$\sum_{k \in \mathbb{Z}_L} \langle L^{k\lambda} u_k, u_k \rangle \geq \sum_{|k| \leq \frac{h_0}{\lambda}} \langle L^{k\lambda} u_k, u_k \rangle + \nu \sum_{|k| > \frac{h_0}{\lambda}} \|u_k\|^2$$

$$= \sum_{|k| \leq \frac{h_0}{\lambda}} \left[ \mu^{k\lambda}_0 \alpha_k^2 + \langle \psi^k_0, L^{k\lambda} u^\perp_k \rangle \right] + \nu \sum_{|k| > \frac{h_0}{\lambda}} \|u_k\|^2$$

$$\geq \sum_{|k| \leq \frac{h_0}{\lambda}} \left[ \mu^{k\lambda}_0 \alpha_k^2 + D \|u^\perp_k\|^2 \right] + \nu \sum_{|k| > \frac{h_0}{\lambda}} \|u_k\|^2. \quad (6.13)$$

Therefore, see (6.12),  
$$C\lambda^2 \geq \sum_{|k| \leq \frac{h_0}{\lambda}} \left[ \mu^{k\lambda}_0 \alpha_k^2 + D \|u^\perp_k\|^2 \right] + \nu \sum_{|k| > \frac{h_0}{\lambda}} \|u_k\|^2. \quad (6.14)$$

Since $\mu^{k\lambda}_0 \geq 0$, see (5.13), the three terms on the right hand side of (6.14) are positive, hence  
$$\sum_{|k| \leq \frac{h_0}{\lambda}} \mu^{k\lambda}_0 \alpha_k^2 \leq C\lambda^2, \quad (6.15)$$
\[
\sum_{|k| \leq \frac{h_0}{\lambda}} \|u_k\|^2 \leq \frac{C}{D} \lambda^2, \quad (6.16)
\]
\[
\sum_{|k| > \frac{h_0}{\lambda}} \|u_k\|^2 \leq \frac{C}{\nu} \lambda^2. \quad (6.17)
\]

By Proposition 5.6, since \(\mu_0 \geq 0\),
\[
\sum_{|k| \leq \frac{h_0}{\lambda}} \mu_0^k \lambda^2 \alpha_k^2 = \sum_{|k| \leq \frac{h_0}{\lambda}} [\mu_0^k \lambda - \mu_0^0] \alpha_k^2 \leq \sum_{|k| \leq \frac{h_0}{\lambda}} [\mu_0^k \lambda - \mu_0^0] \alpha_k^2
\]
\[
> C_0 \sum_{|k| \leq \frac{h_0}{\lambda}} [(k \lambda)^2] \alpha_k^2. \quad (6.18)
\]

Hence, by (6.15)
\[
\sum_{|k| \leq \frac{h_0}{\lambda}} k^2 \alpha_k^2 \leq \frac{C}{C_0}. \quad (6.19)
\]

Define
\[
Z(s) = \sum_{|k| \leq \frac{h_0}{\lambda}} e^{ik \lambda} \alpha_k, \quad (6.20)
\]
\[
V^R(s, z) = V_2(s, z) + V_3(s, z), \quad (6.21)
\]
where
\[
V_2(s, z) = \sum_{|k| \leq \frac{h_0}{\lambda}} e^{ik \lambda} u_k^\perp + \sum_{|k| > \frac{h_0}{\lambda}} e^{ik \lambda} u_k(z), \quad (6.22)
\]
\[
V_3(s, z) = \sum_{|k| \leq \frac{h_0}{\lambda}} e^{ik \lambda} \alpha_k [\psi_0^k \lambda - \psi_0^0]. \quad (6.23)
\]

Then
\[
V(s, z) = Z(s) \psi_0^0(z) + V^R(s, z). \quad (6.24)
\]

By (6.16) and (6.17)
\[
\|V_2\|^2 \leq C \lambda^2.
\]

By (5.12) and (6.19)
\[
\|V_3\|^2 = \sum_{|k| \leq \frac{h_0}{\lambda}} \alpha_k^2 \|\psi_0^k \lambda - \psi_0^0\|^2 \leq \lambda^2 \sum_{|k| \leq \frac{h_0}{\lambda}} \alpha_k^2 k^2 \leq \lambda^2 C.
\]

Hence \(\|V^R\|^2 \leq C \lambda^2\), \(1 - C \lambda^2 \leq \|Z\|^2 \leq 1\),
\[
\|\nabla_s Z\|^2 = \sum_{|k| \leq \frac{h_0}{\lambda}} k^2 \alpha_k^2 \leq C. \quad (6.25)
\]

In this way we get the decomposition (6.9), (6.10) in the toy model. The proof of Theorem 6.2 is more complicated because terms outside diagonal are present.
6.2. Expansion of $A$ in term of $G$. In this subsection we decompose $A = G + R$, but the $L^2$ norm of $R$ is not of order $\lambda^2$. Nevertheless we show that when $V$ satisfies (6.8) then $\langle AV, V \rangle \approx \langle GV, V \rangle + C\lambda^2 |V|^2$.

We start writing the operator $B$ defined in (4.43) in term of a convolution operator plus an operator involving the first derivative with respect to the $s-$ variable of $V$, plus a remainder. The remainder for general $L^2(T_\lambda)$ functions is of order 1 in $L^2(T_\lambda)$, so it is not small. To get the remainder small we need to require decay properties of $V$. They hold when $V$ satisfies (6.8).

Lemma 6.3. Let $V \in H^1(T_\lambda)$ and $B$ be the operator defined in (4.43). We have

\[ (BV)(s, z) = \int_{T_\lambda} \frac{1}{\lambda} J \left( \frac{(s - s')}{\lambda}, (z - z') \right) V(s', z') ds' dz' \]

\[ - \lambda^2 \int_{T_\lambda} \frac{1}{\lambda} J \left( \frac{(s - s')}{\lambda}, (z - z') \right) \left[ \frac{(s - s')}{\lambda} k(s^*) z^* \alpha(s^*, z^*) D_{s'} V(s', z') \right] ds' dz' \]

\[ + (R^\lambda V)(s, z) \]

where $R^\lambda$ is defined in (6.33).

Proof. Set $x_0 = \frac{(s - s')}{\lambda}$ and $x = \frac{(s - s')}{\lambda} \alpha(s^*, z^*)$. We expand $J$ in Taylor formula, up to second order, at the point $x_0$ and for any given $z \in I_\lambda$. We obtain

\[ J(x, z) = J(x_0, z) + D_1 J(x_0, z)(x - x_0) \]

\[ + \frac{1}{2} \int_{x_0}^x D_{11} J(x', z)(x_0 - x') dx'. \]  

(6.27)

We denoted by $D_1 J$ and by $D_{11} J$ the first derivative and respectively the second derivative of $J$ with respect to the first argument. Recalling that the support of $J$ is the ball of radius 1 we have that $|s - s'| \leq \lambda$, $|z - z'| \leq 1$ and $(x - x_0) = -\frac{1}{\lambda}(s - s') \lambda k(s^*) z^* \approx \lambda k(s^*) z^*$. We set

\[ M(s, s', z, z') = \frac{1}{2} \int_{x_0}^x D_{11} J(x', z)(x_0 - x') dx'. \]

(6.28)

By the properties of $J$ and the boundness of the curvature

\[ |M(s, s', z, z')| \leq \lambda^2 C(z^*)^2 \|_{|s - s'| \leq \lambda} \|_{|z - z'| \leq 1}. \]

(6.29)

By (6.27), taking into account that $\alpha(s^*, z^*) = 1 - \lambda k(s^*) z^*$, we have

\[ (BV)(s, z) = \int_{T_\lambda} \frac{1}{\lambda} J \left( \frac{(s - s')}{\lambda}, (z - z') \right) \alpha(s^*, z^*) V(s', z') ds' dz' \]

\[ = \int_{T_\lambda} \frac{1}{\lambda} J \left( \frac{(s - s')}{\lambda}, (z - z') \right) V(s', z') ds' dz' \]

\[ - \lambda \int_{T_\lambda} \frac{1}{\lambda} J \left( \frac{(s - s')}{\lambda}, (z - z') \right) k(s^*) z^* V(s', z') ds' dz' \]

\[ - \lambda \int_{T_\lambda} \frac{1}{\lambda} (D_1 J) \left( \frac{(s - s')}{\lambda}, (z - z') \right) \frac{1}{\lambda}(s - s') k(s^*) z^* \alpha(s^*, z^*) V(s', z') ds' dz' \]

\[ + \frac{1}{\lambda} \int_{T_\lambda} M(s, s', z, z') \alpha(s^*, z^*) V(s', z') ds' dz'. \]

(6.30)

Since

\[ (D_1 J) \left( \frac{(s - s')}{\lambda}, (z - z') \right) = \lambda (D_{s'} J) \left( \frac{(s - s')}{\lambda}, (z - z') \right) = -\lambda(D_{s'} J) \left( \frac{(s - s')}{\lambda}, (z - z') \right) \]

\[ \lambda \int_{T_\lambda} \frac{1}{\lambda} (D_{s'} J) \left( \frac{(s - s')}{\lambda}, (z - z') \right) \frac{1}{\lambda}(s - s') k(s^*) z^* \alpha(s^*, z^*) V(s', z') ds' dz' \]

\[ + \frac{1}{\lambda} \int_{T_\lambda} M(s, s', z, z') \alpha(s^*, z^*) V(s', z') ds' dz'. \]
we obtain

\[
\int_{T_\lambda} (D_1 J) \left( \frac{(s-s')}{\lambda}, (z-z') \right) \frac{1}{\lambda} (s-s') k(s^*) z^* \alpha(s^*, z^*) V(s', z') ds' dz'
\]
\[
= - \int_{T_\lambda} (D_\nu J) \left( \frac{(s-s')}{\lambda}, (z-z') \right) (s-s') k(s^*) z^* \alpha(s^*, z^*) V(s', z') ds' dz'
\]
\[
= \int_{T_\lambda} J \left( \frac{(s-s')}{\lambda}, (z-z') \right) D_\nu' \left[ (s-s') k(s^*) z^* \alpha(s^*, z^*) V(s', z') \right] ds' dz'
\]
\[
= - \int_{T_\lambda} J \left( \frac{(s-s')}{\lambda}, (z-z') \right) k(s^*) z^* [1 - \lambda k(s^*) z^*] V(s', z') ds' dz'
\]
\[
\quad + \int_{T_\lambda} J \left( \frac{(s-s')}{\lambda}, (z-z') \right) (s-s') k(s^*) z^* \alpha(s^*, z^*) V(s', z') ds' dz'
\]
\[
\quad + \int_{T_\lambda} J \left( \frac{(s-s')}{\lambda}, (z-z') \right) (s-s') k(s^*) z^* D_\nu V(s', z') ds' dz'
\]
\[
\quad + \int_{T_\lambda} J \left( \frac{(s-s')}{\lambda}, (z-z') \right) (s-s') k(s^*) z^* \alpha(s^*, z^*) V(s', z') ds' dz'.
\]

We replaced \( \alpha(s^*, z^*) = 1 - \lambda k(s^*) z^* \) in the first term of the last equality of (6.31). We insert (6.31) into the third term of the last equality in (6.30). Notice that we must multiply (6.31) by \(-\lambda^2 \). We obtain

\[
\int_{T_\lambda} J^\nu (s, s', z, z') V(s', z') ds' dz' = \int_{T_\lambda} \frac{1}{\lambda} J \left( \frac{(s-s')}{\lambda}, (z-z') \right) V(s', z') ds' dz'
\]
\[
\quad - \lambda \int_{T_\lambda} \frac{1}{\lambda} J \left( \frac{(s-s')}{\lambda}, (z-z') \right) [(s-s') k(s^*) z^* \alpha(s^*, z^*) D_\nu V(s', z')] ds' dz'
\]
\[
\quad + (R^3 V)(s, z),
\]

where

\[
(R^3 V)(s, z) = -\lambda^2 \int_{T_\lambda} \frac{1}{\lambda} J \left( \frac{(s-s')}{\lambda}, (z-z') \right) \left[ (k(s^*) z^*)^2 V(s', z') \right] ds' dz'
\]
\[
\quad - \lambda^2 \int_{T_\lambda} \frac{1}{\lambda} J \left( \frac{(s-s')}{\lambda}, (z-z') \right) \left[ \frac{1}{2} k_\nu(s^*) z^* \alpha(s^*, z^*) V(s', z') \right] ds' dz'
\]
\[
\quad - \lambda^3 \int_{T_\lambda} \frac{1}{\lambda} J \left( \frac{(s-s')}{\lambda}, (z-z') \right) \left[ (s-s') k(s^*) k_\nu(s^*) (k^*)^2 V(s', z') \right] ds' dz'
\]
\[
\quad + \int_{T_\lambda} \frac{1}{\lambda} M(s, s', z, z') \alpha(s^*, z^*) V(s', z') ds' dz',
\]

with \( M \) defined in (6.28). The term

\[
-\lambda \int_{T_\lambda} \frac{1}{\lambda} J \left( \frac{(s-s')}{\lambda}, (z-z) \right) k(s^*) z^* V(s', z') ds' dz'
\]

appearing in the third lines of (6.30) cancels with the first addend of the last equality of (6.31) when multiplied by \(-\lambda^2 \).

We have the following

**Lemma 6.4.** Let \( V \in L^2(T_\lambda) \) with the property that there exists \( z_0 \) and \( a > 0 \) so that

\[
\int_T |s V(s, z)|^2 \leq e^{-a|z|} ||V||^2 \quad \text{for } |z| \geq z_0.
\]

(6.34)
Let $R^\lambda$ be the quantity defined in (6.33), there exists $C = C(z_0) > 0$ so that
\[ \|R^\lambda V\| \leq \lambda^2 C\|V\|. \]

Proof. Denote
\[ (R_1^\lambda V)(s, z) = -\lambda^2 \int_{\mathcal{T}_\lambda} \frac{1}{\lambda} J \left( \frac{(s-s')}{\lambda}, (z-z') \right) \left[ k(s^*) z^* \right]^2 V(s', z') ds' dz', \]
\[ (R_2^\lambda V)(s, z) = -\lambda^2 \int_{\mathcal{T}_\lambda} \frac{1}{\lambda} J \left( \frac{(s-s')}{\lambda}, (z-z') \right) \left[ \frac{(s-s')^2}{2} k_\nu(s^*) z^* \alpha(s^*, z^*) V(s', z') \right] ds' dz', \]
\[ (R_3^\lambda V)(s, z) = -\lambda^3 \int_{\mathcal{T}_\lambda} \frac{1}{\lambda} J \left( \frac{(s-s')}{\lambda}, (z-z') \right) \left[ k(s^*) k_\nu(s^*) (z^*)^2 V(s', z') \right] ds' dz. \]

By Jensen inequality, (6.34) and taking into account that $|z-z'| \leq 1$, we have
\[ \|R_1^\lambda V\|^2 = \lambda^4 \int_{\mathcal{T}_\lambda} ds dz \left\{ \int_{\mathcal{T}_\lambda} \frac{1}{\lambda} J \left( \frac{(s-s')}{\lambda}, (z-z') \right) \left[ k(s^*) z^* \right]^2 V(s', z') ds' dz' \right\}^2 \]
\[ \leq \lambda^4 C \int_{\mathcal{T}_\lambda} ds dz \int_{\mathcal{T}_\lambda} \frac{1}{\lambda} J \left( \frac{(s-s')}{\lambda}, (z-z') \right) \left[ (z'+1)^2 V(s', z') \right]^2 ds' dz' \]
\[ \leq \lambda^4 C(z_0) \|V\|^2. \]

We estimate similarly the term $R_2^\lambda V$ and $R_3^\lambda V$. By (6.29) and (6.34) we have
\[ \|R_1^\lambda V\|^2 \leq \lambda^4 \int_{\mathcal{T}_\lambda} ds dz \left\{ \frac{1}{\lambda} \int_{\mathcal{T}_\lambda} M(s, s', z, z') \alpha(s^*, z^*) V(s', z') ds' dz' \right\}^2 \]
\[ \leq C \lambda^4 \int_{\mathcal{T}_\lambda} ds dz \left\{ \int_{\mathcal{T}_\lambda} (z')^2 \frac{1}{\lambda} \mathbb{1}_{|s-s'| \leq \lambda} \mathbb{1}_{|z-z'| \leq 1} V(s', z') |ds' dz'| \right\}^2 \]
\[ \leq C \lambda^4 \int_{\mathcal{T}_\lambda} ds dz \int_{\mathcal{T}_\lambda} \frac{1}{\lambda} \mathbb{1}_{|s-s'| \leq \lambda} \mathbb{1}_{|z-z'| \leq 1} (z^*)^2 V(s', z') |ds' dz' \]
\[ \leq C(z_0) \lambda^4 \|V\|^2. \]

Since $R^\lambda V = \sum_{i=1}^4 R_i^\lambda V$, the thesis follows.

Lemma 6.5. Set $V(s, z) = \sum_{h \in \mathbb{Z}_L} e^{ih\alpha} u_h(z)$, see (5.7). We have
\[ \int_{\mathcal{T}_\lambda} ds dz V(s, z) (BV)(s, z) = \sum_{h \neq 0, k \neq 0} \left\{ \delta_{h,k} \int_{\mathcal{I}_\lambda} dz u_h(z) \int_{\mathcal{I}_\lambda} J^{\lambda k}(z-z') u_k(z') dz' + F^\lambda_1(u_h, u_k) \right\} + \int_{\mathcal{T}_\lambda} ds dz V(s, z) (R^\lambda V)(s, z) \]
(6.37)
where $J^{\lambda k}$ is defined in (5.2), $F^\lambda_1(u_h, u_k)$ in (6.41).
Proof. From (6.26) we have
\[
\int_{T} dsdzV(s, z)(BV)(s, z) \\
= \sum_{h,k} \int_{T} dsdz e^{ih\cdot s} u_{h}(z) \int_{T} \frac{1}{\lambda} J \left( \frac{(s-s')}{\lambda}, (z-z') \right) e^{iks' u_{k}(z')} ds'dz' \\
- \lambda^{2} \sum_{h,k} \int_{T} dsdz e^{-ih\cdot s} u_{h}(z) \int_{T} \frac{1}{\lambda} J \left( \frac{(s-s')}{\lambda}, (z-z') \right) \left[ \frac{(s-s')}{\lambda} k(s^{*}) z^{*} ike^{iks' u_{k}(z')} \right] ds'dz' \\
+ \int_{T} dsdzV(s, z)(R^{\lambda} V)(s, z).
\]
(6.38)

We have that
\[
\int_{T} dsdz e^{-ih\cdot s} u_{h}(z) \int_{T} \frac{1}{\lambda} J \left( \frac{(s-s')}{\lambda}, (z-z') \right) e^{iks' u_{k}(z')} ds'dz' \\
= \int_{T} dsdz e^{-ih\cdot s} u_{h}(z) J^{\lambda k}(z-z') u_{k}(z') = \delta_{h,k} \int_{I_{h}} dz u_{h}(z) \int_{I_{h}} J^{\lambda k}(z-z') u_{k}(z') dz' \\
\text{where, see (5.2),}
\]
\[
J^{\lambda k}(z-z') = \int_{T} \frac{1}{\lambda} J \left( \frac{(s-s')}{\lambda}, (z-z') \right) e^{ik\lambda (z-z')} ds' = \int_{T} J(w, (z-z')) e^{-ik\lambda w} dw.
\]
(6.39)

Set
\[
F_{1}^{\lambda}(u_{h}, u_{k}) = -ik\lambda^{2} \int_{T_{h}} dsdz e^{-ih\cdot s} u_{h}(z) e^{iks} \int_{T} \frac{1}{\lambda} J \left( \frac{(s-s')}{\lambda}, (z-z') \right) \left( \frac{(s-s')}{\lambda} k(s^{*}) e^{iks' u_{k}(z')} \right) ds'dz' \\
= -ik\lambda^{2} \int_{I_{h}} dz u_{h}(z) \int_{I_{h}} z^{*} u_{k}(z') dz' \int_{T} J(w, (z-z')) e^{-ik\lambda w} dw \\
= -ik\lambda^{2} \int_{I_{h}} dz u_{h}(z) \int_{I_{h}} z^{*} u_{k}(z') dz' \int_{T} J(w, (z-z')) e^{-ik\lambda w} dw \\
= -ik\lambda^{2} \int_{I_{h}} dz u_{h}(z) \int_{I_{h}} z^{*} u_{k}(z') dz' \int_{T} J(w, (z-z')) e^{-ik\lambda w} dw \\
= -k\lambda^{2} \int_{I_{h}} dz u_{h}(z) \int_{I_{h}} z^{*} u_{k}(z') dz' \int_{T} J(w, (z-z')) e^{-ik\lambda w} dw \\
(6.40)
\]

We use that \( s^{*} = \frac{s+x}{2} = s + \frac{x-s}{2} \) and therefore \( k(s^{*}(w)) = k(s + \frac{1}{2} \lambda w) \).
\( \square \)

**Remark 6.6.** Notice that when \( v \) and \( w \) are even function
\[
F_{1}^{\lambda}(v, w) = 0.
\]

**Lemma 6.7.** Take \( \| V \| = 1, V(s, z) = \sum_{k \in \mathbb{Z}} e^{ik\cdot s} u_{k}(z) \), see (5.7),
\[
\langle V, A V \rangle \leq C \lambda^{2},
\]
(6.42)

where the operator \( A \) is defined in (4.44). Then
\[
\langle V, A V \rangle - \langle V, R_{0}^{\lambda} V \rangle = \sum_{k \in \mathbb{Z}} \delta_{h,k} \langle u_{h}, L^{\lambda} u_{k} \rangle + F_{1}^{\lambda}(u_{h}, u_{k}) + F_{2}^{\lambda}(u_{h}, u_{k}) + F_{3}^{\lambda}(u_{h}, u_{k}) \},
\]
(6.43)

\[
\langle V, R_{0}^{\lambda} V \rangle \leq C \lambda^{2},
\]
(6.44)

see (6.60), where \( F_{1}^{\lambda} \) is given in (6.41), \( F_{2}^{\lambda} \) in (6.56) and \( F_{3}^{\lambda} \) in (6.57). Further we have for \( u \) and \( v \) even function
\[
F_{1}^{\lambda}(u, v) = F_{2}^{\lambda}(u, v) = F_{3}^{\lambda}(u, v) = 0,
\]
(6.45)

\[
|F_{1}^{\lambda}(u_{h}, u_{k})| \leq \lambda^{2} |k| C \left( \frac{1}{k} \frac{1}{1+(k-h)} \right) \left( \frac{1}{1+(k-h)\lambda} \right)^{1} \| u_{h} \| \| u_{k} \|,
\]
(6.46)
By (3.10) and definitions (3.20), (3.21) and (3.22) we obtain
\[ |F_2^\lambda(u_h, u_k) + F_3^\lambda(u_h, u_k)| \leq C \lambda \|u_k\| \|u_h\| \frac{1}{(1 + |k - h|)^3}. \tag{6.47} \]

**Proof.** From (6.42) it follows that \( V \) satisfies (6.34), i.e., there exists \( z_0 \) and \( a > 0 \) so that
\[ \int_T ds V(s, z)^2 \leq e^{-a|z|} \|V\|^2 \quad \text{for} \quad |z| \geq z_0. \tag{6.48} \]
Namely, by Lemma 4.11, one deduces that the eigenfunctions \( \{\psi_i\}_i \) associated to eigenvalues of \( \mathcal{A} \) smaller than some \( \epsilon_0 \) decay as (6.48). Therefore we can write for some positive integer \( N \), \( V = \sum_i \psi_i(s, z) \) where \( a_i = \int_{T \times A} dsdz \psi_i(s, z) V(s, z) \). We get
\[ \int_T ds V(s, z)^2 = \sum_{i} a_i^2 \int_T ds \psi_i^2(s, z) \leq e^{-a|z|} \sum_i a_i^2 \|\psi_i\|^2 = C e^{-a|z|} \|V\|^2 \quad \text{for} \quad |z| \geq z_0. \tag{6.49} \]
By (3.10) and definitions (3.20), (3.21) and (3.22) we obtain
\[ \int_{T \times A} dsdz \frac{V(s, z)^2}{\sigma(m_A(s, \lambda z))} = \int_{T \times A} dsdz \frac{V(s, z)^2}{\beta(1 - \overline{m}^2(z))} + \int_T ds [I_{2,s}(V) + I_{3,s}(V) + I_{4,s}(V)]. \tag{6.50} \]
We write
\[ I_{3,s}(V) = \lambda \int_{T \times A} dsdz \frac{(V(s, z))^2}{\beta(1 - \overline{m}^2(z))^2} \overline{m}(z) \phi(s, 0) \]
\[ + \lambda^2 \int_{T \times A} dsdz \frac{(V(s, z))^2}{\beta(1 - \overline{m}^2(z))^2} \overline{m}(z)[\phi(s, z) - \phi(s, 0)]. \tag{6.51} \]
By (2.16) and (6.48) we get
\[ \left| \int_{T \times A} dsdz \frac{(V(s, z))^2}{\beta(1 - \overline{m}^2(z))^2} \overline{m}(z)[\phi(s, z) - \phi(s, 0)] \right| \leq C \|V\|^2. \tag{6.52} \]
Hence by (6.50) and (6.51)
\[ \int_{T \times A} dsdz \frac{(V(s, z))^2}{\sigma(m_A(s, \lambda z))} = \int_{T \times A} dsdz \frac{(V(s, z))^2}{\beta(1 - \overline{m}^2(z))} \]
\[ + 2 \lambda \int_{T \times A} dsdz \frac{(V(s, z))^2}{\beta(1 - \overline{m}^2(z))^2} \overline{m}(z)[h_1(z)g(s) + \phi(s, 0)] + \lambda^2 \int_{T \times A} dsdz R_1(s, z)(V(s, z))^2, \tag{6.53} \]
where we denoted by
\[ R_1(s, z) = \frac{1}{\beta(1 - \overline{m}^2(z))^2} \overline{m}(z)[\phi(s, z) - \phi(s, 0)] + q^\lambda(s, \lambda z). \]
By (6.52) and (2.14) we have that
\[ \langle V, R_1V \rangle \leq C \|V\|^2. \tag{6.54} \]
Set \( V(s, z) = \sum_k e^{ik_s} u_k(z) \). Taking into account (6.53) we have
\[ \int_{T \times A} dsdz \frac{(V(s, z))^2}{\sigma(m_A(s, \lambda z))} = \sum_k \int_{T \times A} dz \frac{(u_k(z))^2}{\sigma(\overline{m}(z))} + \sum_k \sum_h \left[F_2^\lambda(u_h, u_k) + F_3^\lambda(u_h, u_k)\right] \]
\[ + \lambda^2 \int_{T \times A} dsdz R_1(s, z)(V(s, z))^2, \tag{6.55} \]
where
\[ F_2^\lambda(u_h, u_k) = 2 \lambda \int_{T \times A} dz \frac{u_k(z) u_h(z)}{\beta(1 - \overline{m}^2(z))^2} \overline{m}(z) h_1(z) \int_T ds e^{i(k-h)s} g(s) \tag{6.56} \]
\[
F_3^\lambda(u_h, u_k) = 2\lambda \int_{I_\lambda} dz \frac{u_k(z)u_h(z)}{\beta(1 - \bar{m}^2(z))^2} \bar{m}(z) \int_T \frac{dse^{i(k-h)s}\phi(s,0)}{\beta}.
\] (6.57)

Then by Lemma 6.5
\[
\langle V, L^\lambda V \rangle - \langle V, R^\lambda V \rangle + \lambda^2 \langle V, R_1 V \rangle = \sum_{k, h} \{ \delta_{h,k} \langle u_h, \mathcal{L}^k u_k \rangle + F_1^\lambda(u_h, u_k) + F_2^\lambda(u_h, u_k) + F_3^\lambda(u_h, u_k) \}.
\] (6.58)

Since \( V \) satisfies the decay property (4.61) we can apply Lemma 6.4 obtaining
\[
\langle V, R^\lambda V \rangle \leq C\lambda^2 ||V||^2.
\] (6.59)

Denote
\[
\langle V, R_0^\lambda V \rangle = \lambda^2 \langle V, R_1 V \rangle + \langle V, R^\lambda V \rangle.
\] (6.60)

By (6.54) and (6.59) we get (6.44). By inspection one realises that when \( u \) and \( v \) are even (6.45) holds. Further, since
\[
u_h(z) = \int V(s, z)e^{ish} ds
\]
then, see (4.61),
\[
|u_h(z)| \leq \int |V(s, z)| ds \leq C \left( \int |V(s, z)|^2 ds \right)^{\frac{1}{2}} \leq Ce^{-a|z|} ||V||, \quad |z| \geq z_0,
\] (6.61)

where \( a > 0 \) and \( z_0 > 0 \) do not depend on \( \lambda \). To estimate \( F_i, i = 1, 2, 3 \) we use the smoothness of \( J, \Gamma \) and \( m_A \). We therefore use estimate (5.3),
\[
\left| \int_T dse^{i(k-h)s} k(s) \right| \leq \frac{C}{(1 + |k-h|)^3},
\] (6.62)
\[
\left| \int_T dse^{i(k-h)s} g(s) \right| \leq \frac{C}{(1 + |k-h|)^3},
\]
\[
\left| \int_T dse^{i(k-h)s} \Phi(s,0) \right| \leq \frac{C}{(1 + |k-h|)^3}.
\]

To estimate \( F_2^\lambda \) we bound \( |z^a| \leq |z + 1| \) since \( J \) has support in the ball of radius 1. The exponential decay of the \( u_h \), see (6.61), is essential to control the growing of \( |z + 1| \). We get
\[
|F_2^\lambda(u_h, u_k)| \leq \lambda^2 |k| C \frac{1}{(1 + |k-h|)^3} \left( 1 + \frac{1}{\beta(3k-h)|\lambda|} \right) \int_{I_\lambda} dz |u_k(z)| |z + 1| \int_{I_\lambda} C(z - z')|u_k(z')| dz'
\]
\[
\leq \lambda^2 |k| C \frac{1}{(1 + |k-h|)^3} \left( 1 + \frac{1}{\beta(3k-h)|\lambda|} \right) ||u_h|| ||u_k||,
\] (6.63)
\[
|F_3^\lambda(u_h, u_k) + F_3^\lambda(u_h, u_k)| \leq C\lambda ||u_h|| ||u_k|| \frac{1}{(1 + |k-h|)^3}.
\] (6.64)

**Proof of Theorem 6.2** By assumption, \( \langle V, \mathcal{A}V \rangle \leq C\lambda^2 \), see (6.8), hence Lemma (6.7) holds. Take \( V(s, z) \) as in (5.7) and consider the representation of \( \langle V, \mathcal{A}V \rangle \) given in (6.43). We start considering the diagonal term, i.e. when \( h = k \). We need to lower bound the following quantity,
\[
\sum_k \{ \langle u_k, \mathcal{L}^k u_k \rangle + F_1^\lambda(u_k, u_k) + F_2^\lambda(u_k, u_k) + F_3^\lambda(u_k, u_k) \}.
\] (6.65)
Therefore, \( \psi_0^{k\lambda} \) is the principal eigenvalue of \( L^{k\lambda} \) and
\[
\int dz \psi_0^{k\lambda}(z) u_k^1(z) = 0.
\]

By (5.11)
\[
\langle u_k, L^{k\lambda} u_k \rangle = \mu_0^{k\lambda} \alpha_k^2 + \langle u_k^1, L^{k\lambda} u_k^1 \rangle \geq \mu_0^{k\lambda} \alpha_k^2 + D\|u_k^1\|^2.
\]

By Proposition 5.6 the principal eigenvalue of the operator \( L^{k\lambda} \) is even, hence for \( i = 1, 2, 3 \)
\[
F_i(\psi_0^{k\lambda}, \psi_0^{k\lambda}) = 0, \quad |\lambda h| \leq h_0, \quad |\lambda k| \leq h_0,
\]
and
\[
F_i^\lambda(u_k, u_h) = F_i^\lambda(\alpha_k \psi_0^{k\lambda}, u_k^1) + F_i^\lambda(\alpha_h \psi_0^{k\lambda}, u_h^1) + F_i^\lambda(u_k^1, u_h^1).
\]

Property (6.67) is essential to obtain the final estimate. Taking into account (6.46), (6.47) and (6.67) we have
\[
|F_1^\lambda(u_k, u_k)| \leq \lambda^2 |k| C \frac{1}{(1 + |k|)} [2|\alpha_k|\|u_k^1\| + \|u_k^1\|] \leq \lambda C ||\alpha_k||\|u_k^1\| + \|u_k^1\|^2, \quad (6.69)
\]
\[
|F_2^\lambda(u_k, u_k) + F_3^\lambda(u_k, u_k)| \leq \lambda C [2|\alpha_k||u_k^1\| + \|u_k^1\|^2]. \quad (6.70)
\]

Therefore
\[
\sum_{|k| \leq \frac{h_0}{\lambda} \atop k \neq h} \left\{ \langle u_k, L^{k\lambda} u_k \rangle + F_1^\lambda(u_k, u_k) + F_2^\lambda(u_k, u_k) + F_3^\lambda(u_k, u_k) \right\}
\]
\[
\geq \sum_{|k| \leq \frac{h_0}{\lambda} \atop k \neq h} \left\{ \mu_0^{k\lambda} \alpha_k^2 + D\|u_k^1\|^2 - \lambda C [\|u_k^1\| + \|u_k^1\|^2] \right\} \quad (6.71)
\]
\[
\geq \sum_{|k| \leq \frac{h_0}{\lambda} \atop k \neq h} \left\{ \mu_0^{k\lambda} \alpha_k^2 + [D - \lambda C\|u_k^1\|] \right\}.
\]

When \( |k| > \frac{h_0}{\lambda} \), taking advantage that \( \lambda^2 \frac{|k|}{(1 + |k|)} \leq \lambda \), and by (6.46), (6.47) we get
\[
|\sum_i F_i^\lambda(u_k, u_k)| \leq \lambda C\|u_k\|^2.
\]

Hence
\[
\sum_{|k| > \frac{h_0}{\lambda} \atop k \neq h} \left\{ \langle u_k, L^{k\lambda} u_k \rangle + F_1^\lambda(u_k, u_k) + F_2^\lambda(u_k, u_k) + F_3^\lambda(u_k, u_k) \right\}
\]
\[
\geq \sum_{|k| > \frac{h_0}{\lambda} \atop k \neq h} [\nu - \lambda C]\|u_k\|^2. \quad (6.72)
\]

Next we estimate the terms outside diagonal, i.e. \( h \neq k \):
\[
\sum_{k, h, h \neq h} \left[ F_1^\lambda(u_k, u_k) + F_2^\lambda(u_h, u_k) + F_3^\lambda(u_h, u_k) \right]
\]
\[
= \left[ \sum_{|k| \leq h_0 \atop \lambda \leq h_0, h \neq h} + \sum_{|k| \leq h_0 \atop \lambda \leq h_0, h \neq h} + \sum_{|\lambda| > h_0 \atop \lambda \leq h_0} + \sum_{|\lambda| > h_0 \atop \lambda \leq h_0} + \sum_{|\lambda| > h_0 \atop \lambda > h_0} + \sum_{|\lambda| > h_0 \atop \lambda > h_0} \right] \sum_F F_i^\lambda(u_h, u_k). \quad (6.73)
\]

We estimate each term of (6.73). We control the double sums using that
\[
\forall k \sum_{h} \frac{1}{(1 + |k - h|)^2} \leq C, \quad \sum_{h} \frac{1}{(1 + |k - h|)^2} \leq C.
\]
When \(|k\lambda| \leq h_0\) we decompose \(u_k\) as in (6.66). When \(|k\lambda| \leq h_0\) and \(|h\lambda| \leq h_0\) we take advantage of (6.67) and (6.68). By (6.46) we obtain

\[
\sum_{|k\lambda| \leq h_0} \sum_{|h\lambda| \leq h_0, h \neq k} |F_1^\lambda(u_h, u_k)|
\leq \lambda^2 \sum_{|k\lambda| \leq h_0} \sum_{|h\lambda| \leq h_0, h \neq k} \frac{|k|}{(1 + |k - h|)^3} \left(1 + \frac{1}{2} (3k - h)\right) \left[|\alpha_k| \|u_h^0\| + \|u_h^1\| \|u_k^1\|\right]
\leq \lambda h_0 \sum_{|k\lambda| \leq h_0} \sum_{|h\lambda| \leq h_0, h \neq k} \frac{1}{(1 + |k - h|)^3} \left[|\alpha_k| \|u_h^0\| + \frac{1}{2} \|u_h^1\|^2 + \frac{1}{2} \|u_k^1\|^2\right]
\leq \lambda h_0 C \left\{ \sum_{|h\lambda| \leq h_0} \|u_h^0\|^2 + \sum_{|k\lambda| \leq h_0} \sum_{|h\lambda| \leq h_0, h \neq k} \frac{1}{(1 + |k - h|)^3} |\alpha_k| \|u_h^1\| \right\}.
\] (6.74)

Taking into account (6.67) and (6.68), applying estimate (6.47) and proceeding as above we get

\[
\sum_{|k\lambda| \leq h_0} \sum_{|h\lambda| \leq h_0, h \neq k} |F_2^\lambda(u_h, u_k) + F_3^\lambda(u_h, u_k)|
\leq \lambda C \left\{ \sum_{|h\lambda| \leq h_0} \|u_h^0\|^2 + \sum_{|k\lambda| \leq h_0} \sum_{|h\lambda| \leq h_0, h \neq k} \frac{1}{(1 + |k - h|)^3} |\alpha_k| \|u_h^1\| \right\}.
\] (6.75)

Next we consider the case when \(|k\lambda| \leq h_0\) and \(|h\lambda| > h_0\). By (6.46), we get

\[
|F_1^\lambda(u_h, u_k)| \leq \lambda^2 \frac{|k|}{(1 + |k - h|)^3} \frac{1}{(1 + \frac{1}{2} (3k - h)\right) \left[|\alpha_k| \|u_h^0\| + \|u_h^1\| \|u_k^1\|\right]
\leq \lambda h_0 \frac{1}{(1 + |k - h|)^3} \left[\frac{1}{2} \|u_h^0\|^2 + \frac{1}{2} \|u_h^1\|^2 + \|\alpha_k\| \|u_h\| \right].
\] (6.76)

By (6.47), proceeding as above,

\[
|F_2^\lambda(u_h, u_k) + F_3^\lambda(u_h, u_k)| \leq \lambda \frac{1}{(1 + |k - h|)^3} \left[\frac{1}{2} \|u_h^0\|^2 + \frac{1}{2} \|u_h^1\|^2 + \|\alpha_k\| \|u_h\| \right].
\] (6.77)

Therefore

\[
\sum_{|k\lambda| \leq h_0} \sum_{|h\lambda| > h_0} \sum_i |F_i^\lambda(u_h, u_k)|
\leq \lambda C \sum_{|k\lambda| \leq h_0} \sum_{|h\lambda| > h_0} \frac{1}{(1 + |k - h|)^3} \left[\frac{1}{2} \|u_h^0\|^2 + \frac{1}{2} \|u_h^1\|^2 + \|\alpha_k\| \|u_h\| \right]
\leq \lambda C \sum_{|k\lambda| \leq h_0} \|u_h^0\|^2 + \lambda C \sum_{|h\lambda| > h_0} \|u_h^0\|^2 + \lambda C \sum_{|k\lambda| \leq h_0} \sum_{|h\lambda| > h_0} \frac{1}{(1 + |k - h|)^3} |\alpha_k| \|u_h\|.
\] (6.78)
When $|k\lambda| > h_0$ and $|h\lambda| < h_0$ the estimate of $|F^\lambda_2(u_h, u_k) + F^\lambda_3(u_h, u_k)|$ gives similar terms as in (6.77), with $h$ replacing $k$. To estimate $F^\lambda_1$ we note that $|k| \leq |k - h| + |h|$. Therefore by (6.46)

$$
\sum_{|k\lambda| > h_0} \sum_{|h\lambda| \leq h_0} |F^\lambda_1(u_h, u_k)| \\
\leq \lambda^2 \sum_{|k\lambda| > h_0} \sum_{|h\lambda| \leq h_0} |k| \left( \frac{1}{1 + |k - h|} \right)^3 \left( \frac{1}{1 + \frac{1}{2} (3k - h)|\lambda|} \right) \|u_h\| \|u_k\| \\
\leq \lambda^2 \sum_{|k\lambda| > h_0} \sum_{|h\lambda| \leq h_0} |k - h| \left( \frac{1}{1 + |k - h|} \right)^3 \|u_h\| \|u_k\| \\
+ \lambda^2 \sum_{|k\lambda| > h_0} \sum_{|h\lambda| \leq h_0} |k - h| \left( \frac{1}{1 + |k - h|} \right)^3 \|u_h\| \|u_k\| \\
\leq \lambda h_0 \sum_{|k\lambda| > h_0} \sum_{|h\lambda| \leq h_0} \frac{1}{(1 + |k - h|)^3} \|u_h\| \|u_k\| + \lambda^2 \sum_{|k\lambda| > h_0} \sum_{|h\lambda| \leq h_0} \frac{1}{(1 + |k - h|)^3} \|u_h\| \|u_k\|.
$$

(6.79)

Since $|h\lambda| \leq h_0$, we split $u_k$ as in (6.66). Insert this decomposition into (6.79) we get

$$
\sum_{|k\lambda| > h_0} \sum_{|h\lambda| \leq h_0} |F^\lambda_1(u_h, u_k)| \\
\leq \lambda \sum_{|k\lambda| > h_0} \|u_h\|^2 + \lambda \sum_{|h\lambda| < h_0} \|u_k\|^2 + \lambda \sum_{|k\lambda| > h_0} \sum_{|h\lambda| \leq h_0} \frac{1}{(1 + |k - h|)^3} \|u_h\| \|u_k\|.
$$

(6.80)

Next we consider the case when $|k\lambda| > h_0$ and $|h\lambda| > h_0, h \neq k$. The main point is to control the $|k|$ in the estimate of $F^\lambda_1$. When $k$ and $h$ have opposite sign, then

$$
\frac{|k|}{1 + |k - h|} \leq 1.
$$

(6.81)

When $k$ and $h$ have the same sign it might be that $\frac{|k|}{1 + |k - h|} > 1$. But if this is case, then for these values of $h$ and $k$

$$
\frac{\lambda h_0}{1 + \frac{1}{2} (3k - h)|\lambda|} \leq 2.
$$

(6.82)

This statement can be easily verified. Take $k > 0$ the case with $k < 0$ can be treated in the same way. Assume that (6.81) does not hold. This means that, for given $k$, $|k - h| < k - 1$. This inequality is satisfied for $h \in \{1, \ldots, 2k - 1\}$. For such value of $h$ we have that $3k - h \geq k$ and therefore (6.82) holds. Hence

$$
\sum_{|k\lambda| > h_0} \sum_{|h\lambda| > h_0, h \neq k} F^\lambda_1(u_h, u_k) = \sum_{|k\lambda| > h_0} \sum_{|h\lambda| > h_0, h \neq k} F^\lambda_1(u_h, u_k) + \sum_{|k\lambda| > h_0} \sum_{|h\lambda| > h_0, h \neq k} F^\lambda_1(u_h, u_k),
$$

(6.83)

where $\sum'$ is a sum restricted to the $h$ and $k$ so that (6.81) holds, and $\sum''$ is a sum restricted to the $h$ and $k$ so that (6.81) does not hold. By (6.46) and (6.81) we get

$$
\sum_{|k\lambda| > h_0} \sum_{|h\lambda| > h_0, h \neq k} F^\lambda_1(u_h, u_k) \\
\leq \lambda^2 C \sum_{|k\lambda| > h_0} \sum_{|h\lambda| > h_0, h \neq k} \|u_h\| \|u_k\| \\
\leq \lambda^2 C \sum_{|k\lambda| > h_0} \sum_{|h\lambda| > h_0, h \neq k} \|u_h\|^2 + \frac{1}{2} \|u_k\|^2 \\
\leq \lambda^2 C \sum_{|k\lambda| > h_0} \|u_k\|^2.
$$

(6.84)
By (6.46) and (6.82) we get
\[
\sum_{|k\lambda|>h_0} \sum_{|\lambda|>h_0, \lambda\neq k} F_k^\lambda(u_h, u_k) 
\leq \lambda^2 C \sum_{|k\lambda|>h_0} \sum_{|\lambda|>h_0, \lambda\neq k} |k| \left(1 + \frac{1}{|k-h|} \right)^3 \frac{k\lambda}{(1 + \frac{3}{2}(3k-h))\lambda} \|u_h\| \|u_k\| 
\leq \lambda C \sum_{|k\lambda|>h_0} \sum_{|\lambda|>h_0, \lambda\neq k} \frac{1}{(1 + |k-h|)^3} \|u_h\| \|u_k\|. 
\]
(6.85)

By the previous estimates we have
\[
\sum_{k,h,k\neq h} \left[ F_1^\lambda(u_h, u_k) + F_2^\lambda(u_h, u_k) + F_3^\lambda(u_h, u_k) \right] 
\leq \lambda C \left( \sum_{|k\lambda| \leq h_0} \|u_k^\perp\|^2 + \sum_{|k\lambda| > h_0} \|u_k\|^2 \right) 
+ \lambda C \sum_{|k\lambda| \leq h_0} \sum_{|\lambda| > h_0, \lambda \neq k} \frac{1}{(1 + |k-h|)^3} |\alpha_k| \|u_h\| 
+ \lambda C \sum_{|k\lambda| > h_0} \sum_{|\lambda| > h_0, \lambda \neq k} \frac{1}{(1 + |k-h|)^3} |\alpha_k| \|u_k\|. 
\]
(6.86)

Define
\[
b_h = \begin{cases} 
\|u_k^\perp\|, & |h\lambda| \leq h_0 \\
\|u_k\|, & |h\lambda| > h_0. 
\end{cases}
\]

Adding to the (6.86) the terms on the diagonal, i.e. \( F_i^\lambda(u_k, u_k) \), for \( i = 1, 2, 3 \), we get
\[
\left| \sum_{k,h} \left[ F_1^\lambda(u_h, u_k) + F_2^\lambda(u_h, u_k) + F_3^\lambda(u_h, u_k) \right] \right| 
\leq \lambda C \left( \sum_{|k\lambda| \leq h_0} \|u_k^\perp\|^2 + \sum_{|k\lambda| > h_0} \|u_k\|^2 \right) 
+ \lambda C \sum_{|k\lambda| \leq h_0} \sum_{h} \frac{1}{(1 + |k-h|)^3} |\alpha_k| b_h. 
\]
(6.87)

By Schwartz
\[
\sum_{|k\lambda| \leq h_0} \sum_{h} \frac{1}{(1 + |k-h|)^3} |\alpha_k| b_h 
\leq \sqrt{ \sum_{|k\lambda| \leq h_0} \sum_{h} \frac{1}{(1 + |k-h|)^3} |\alpha_k|^2 } \sqrt{ \sum_{|k\lambda| > h_0} \sum_{h} \frac{1}{(1 + |k-h|)^3} b_h^2 } 
\leq C \sqrt{ \sum_{|k\lambda| \leq h_0} |\alpha_k|^2 } \sqrt{ \sum_{h} b_h^2 } \leq C \sqrt{ \sum_{h} b_h^2 }. 
\]
(6.88)
Taking into account (6.43) and (6.44) and estimates (6.71), (6.72) and (6.86) we have
\[
\langle V, AV \rangle - \langle V, R^0 AV \rangle = \sum_{k,h} \{ \delta_{h,k} \langle u_h, c_k^A u_k \rangle + F^1_k (u_h, u_k) + F^2_k (u_h, u_k) + F^3_k (u_h, u_k) \}
\]
\[
\geq \sum_{|k| \leq \frac{\nu}{\lambda}} \mu_{0}^{k\lambda} \alpha_k^{2} + [D - C\lambda] \sum_{|k| \leq \frac{\nu}{\lambda}} \| u_k \|^2 + [\nu - \lambda C] \sum_{|k| > \frac{\nu}{\lambda}} \| u_k \|^2 - \lambda \sqrt{\sum_{k} b_k^2}
\]
(6.89)
Since \( \langle V, AV \rangle \leq C\lambda^2 \), see (6.8), and \( |\langle V, R^0 AV \rangle| \leq C\lambda^2 \), see (6.44), taking \( C \leq \min\{ [D - C\lambda], [\nu - \lambda C] \} \) we get
\[
C\lambda^2 \geq \sum_{|k| \leq \frac{\nu}{\lambda}} \mu_{0}^{k\lambda} \alpha_k^{2} + C \sum_{k} b_k^2 - \lambda \sqrt{\sum_{k} b_k^2}
\]
(6.90)
In the last inequality we use that \( \mu_{0}^{k\lambda} > \mu_{0}^{0} > 0 \), see Proposition 5.6 and Theorem 3.1. Therefore
\[
C\lambda^2 + \lambda \sqrt{\sum_{k} b_k^2} \geq C \sum_{k} b_k^2.
\]
(6.91)
This inequality immediately implies
\[
\sqrt{\sum_{k} b_k^2} \leq C\lambda.
\]
(6.92)
Lower bounding (6.89) by (6.92) we get
\[
C\lambda^2 \geq \sum_{|k| \leq \frac{\nu}{\lambda}} \mu_{0}^{k\lambda} \alpha_k^{2} + [D - C\lambda] \sum_{|k| \leq \frac{\nu}{\lambda}} \| u_k \|^2 + [\nu - \lambda C] \sum_{|k| > \frac{\nu}{\lambda}} \| u_k \|^2.
\]
(6.93)
We get similar estimates as in Subsection 6.1 (Toy model). This implies
\[
\sum_{|k| \leq \frac{\nu}{\lambda}} \mu_{0}^{k\lambda} \alpha_k^{2} \leq C\lambda^2,
\]
(6.94)
\[
\sum_{|k\lambda| \leq h_o} \| u_k \|^2 \leq C\lambda^2,
\]
(6.95)
\[
\sum_{|k\lambda| > h_o} \| u_k \|^2 \leq C\lambda^2.
\]
(6.96)
We therefore define
\[
Z(s) = \sum_{|k| \leq \frac{\nu}{\lambda}} e^{iks} \alpha_k
\]
(6.97)
\[
V^R(s, z) = \sum_{|k| < \frac{\nu}{\lambda}} e^{iks} u_k \big| \big( z \big) + \sum_{|k| > \frac{\nu}{\lambda}} e^{iks} u_k \big( z \big) + \sum_{|k| \leq \frac{\nu}{\lambda}} e^{iks} \alpha_k \big[ \psi_0^{k\lambda}(z) - \psi_0^{0}(z) \big].
\]
(6.98)
Then
\[
V(s, z) = Z(s) \psi_0^{0}(z) + V^R(s, z)
\]
(6.99)
and, proceeding as in Subsection 6.1, the requirements (6.10) hold. \( \square \)
7. Proof of Theorem 2.5

Proof. If \( v = 0 \) then the assertion of the theorem holds. So let \( v \) be non identically equal to zero and assume that \( \int_{\Omega} v^2(\xi) d\xi = 1 \). Proceeding as in the proof of Theorem 2.4 there exists \( k \in \{0, \ldots, N\} \), with \( N = \left\lfloor \frac{1}{\lambda} \right\rfloor \), and cut off functions \( \eta_1 = \eta_1^k \) and \( \eta_2 = 1 - \eta_1^k \) so that

\[
\int_{\Omega} (A_{m,a}^\lambda v)(\xi) v(\xi) d\xi = \int_{\Omega} (A_{m,a}^\lambda \eta_1 v)(\xi) \eta_1(\xi) v(\xi) d\xi
+ \int_{\Omega} (A_{m,a}^\lambda \eta_2 v)(\xi) \eta_2(\xi) v(\xi) d\xi
- 2 \int_{\Omega} d\xi \eta_1(\xi) v(\xi) (J^\lambda \ast \eta_2 v)(\xi),
\]

(7.1)

and

\[
\int_{\Omega} (A_{m,a}^\lambda \eta_2 v)(\xi) \eta_1(\xi) v(\xi) d\xi \geq (C^* - 1)\|\eta_2 v\|_{L^2(\Omega)} > 0,
\]

(7.2)

Without loss of generality we keep on denoting by \( N(d_0) \) the set where \( \eta_1(\xi) = 1 \). The (2.22), (7.2) and (7.3) imply that

\[
\int_{N(d_0)} (A_{m,a}^\lambda \eta_1(\xi) v(\xi)) \eta_1(\xi) v(\xi) d\xi \leq C\lambda^2 - \int_{\Omega \setminus N(d_0)} (A_{m,a}^\lambda \eta_2 v)(\xi) \eta_2 v(\xi) d\xi \leq C\lambda^2.
\]

(7.4)

By (2.22) and (7.3)

\[
\int_{\Omega \setminus N(d_0)} (A_{m,a}^\lambda \eta_1 v)(\xi) \eta_1(\xi) v(\xi) d\xi \leq C\lambda^2 - \int_{N(d_0)} (A_{m,a}^\lambda \eta_1^N(\xi) v(\xi)) \eta_1(\xi) v(\xi) d\xi.
\]

(7.5)

By Lemma 4.2 and Lemma 4.8 we have that

\[
\int_{N(d_0)} (A_{m,a}^\lambda \eta_1 v)(\xi) \eta_1 v(\xi) d\xi \geq -C\lambda^2 \int_{\Omega} v^2(\xi) d\xi = -C\lambda^2.
\]

(7.6)

Then, from (7.5), taking into account (7.6) we obtain

\[
\int_{\Omega \setminus N(d_0)} (A_{m,a}^\lambda \eta_1 v)(\xi) v(\xi) d\xi \leq C\lambda^2.
\]

(7.7)

This together with (7.2) implies

\[
\int_{\Omega \setminus N(d_0)} v^2(\xi) d\xi \leq C\lambda^2,
\]

(7.8)

hence

\[
\int_{N(d_0)} v^2(\xi) d\xi \geq 1 - C\lambda^2.
\]

(7.9)

Therefore, see (7.4) and (7.9), we can apply Theorem 6.1 decomposing \( v \) as

\[
v(r, s) = Z(s) \frac{1}{\sqrt{\alpha(s, r)}} \frac{1}{\sqrt{\lambda}} \psi_0^R(r) + v^R(s, r),
\]

(7.10)

where \( \psi_0^R(\cdot) \) is the first eigenvalue of \( L^0 \), see Theorem 3.1, with

\[
\|v^R\|^2_{L^2(N(d_0))} \leq \lambda^2 C,
\]

(7.11)

and

\[
1 - C\lambda^2 \leq \|Z\|^2_{L^2(T)} \leq 1, \quad \|\nabla Z\|_{L^2(T)} \leq C.
\]

(7.12)
SPECTRAL PROPERTIES

Set
\[ \Delta w = v. \]  

(7.13)

Denote
\[ \hat{w} = \frac{1}{\sqrt{\lambda}} w. \]  

Then, from (7.10)
\[ \Delta \hat{w} = \frac{1}{\sqrt{\lambda}} \left[ Z(s) \frac{1}{\sqrt{\alpha(s, r)}} \frac{1}{\sqrt{\lambda}} \psi_0^R(r) + v^R(s, r) \right]. \]

To show (2.23) it is enough to prove that
\[ \| \nabla \hat{w} \|_{L^2(\Omega)} \geq C \]  

(7.14)

for some positive \( C \) independent on \( \lambda \). Let \( \delta \in (0, \frac{1}{2}] \) a small constant to be determined and let \( \chi \in C_0^\infty(\mathbb{R}) \) be a cut-off function, such that
\[ \chi(x) = 1 \quad \text{if} \quad |x| \leq \frac{1}{2}, \quad \chi(x) = 0 \quad \text{if} \quad |x| > 1, \quad x \chi'(x) \leq 0 \quad \text{in} \quad \mathbb{R}. \]  

(7.15)

Set \( \chi^\delta(x) = \chi(\frac{x}{\delta}) \), with \( \chi \) as in (7.15). We have
\[ \int_{\mathcal{N}(d_0)} Z(s(\xi)) \chi^\delta(r(\xi, \Gamma)) \Delta \hat{w}(\xi) d\xi = \int_{T \times [-\delta, \delta]} Z(s) \chi^\delta(r) \left( Z(s) \frac{1}{\sqrt{\alpha(s, r)}} \frac{1}{\sqrt{\lambda}} \psi_0^R(r) + \frac{1}{\sqrt{\lambda}} v^R(s, r) \right) \alpha(s, r) dr ds. \]  

(7.16)

By (3.7), for \( \delta > \lambda, \int_{[-\delta, \delta]} \frac{1}{\lambda} \psi_0^0(\frac{r}{\lambda}) dr \geq 2m(\frac{1}{\lambda}) + C e^{-\alpha \frac{\xi}{\lambda}} \geq C \). This, together with (7.12), allows to lower bound
\[ \int_{T \times [-\delta, \delta]} \sqrt{\alpha(r, s)} Z^2(s) \chi^\delta(r) \frac{1}{\lambda} \psi_0^R(r) dr ds \geq C \inf_{(r, s) \in T \times [-\delta, \delta]} \sqrt{\alpha(r, s)} \| Z^2 \|^2_{L^2(T)} \int_{[-\delta, \delta]} \frac{1}{\lambda} \psi_0^0(\frac{r}{\lambda}) dr \geq C \| Z^2 \|^2_{L^2(T)} \geq C (1 - \lambda^2). \]  

(7.17)

By Schwartz inequality
\[ \left| \frac{1}{\sqrt{\lambda}} \int_{T \times [-\delta, \delta]} Z(s) \chi^\delta(r) v^R(r, s) \alpha(s, r) dr ds \right| \leq \frac{1}{\sqrt{\lambda}} \| v^R \|_{L^2(\mathcal{N}(\delta))} \left( \int_{T \times [-\delta, \delta]} \alpha(r, s) Z^2(s) [\chi^\delta(r)]^2 dr ds \right)^{\frac{1}{2}} \leq \frac{1}{\sqrt{\lambda}} \| v^R \|_{L^2(\mathcal{N}(\delta))} \left( \sup_{(r, s) \in T \times [-\delta, \delta]} |\alpha(r, s)| \right)^{\frac{1}{2}} \| Z \|_{L^2(T)} \delta^\frac{1}{2} \leq C \delta^\frac{1}{2} \lambda^\frac{1}{2}. \]  

(7.18)

The last inequality is obtained applying (7.11). Then from (7.16), (7.17) and (7.18) we obtain
\[ \int_{\mathcal{N}(d_0)} Z(s(\xi)) \chi^\delta(r(\xi, \Gamma)) \Delta \hat{w}(\xi) d\xi \geq C (1 - \lambda^2) - C \delta^\frac{1}{2} \lambda^\frac{1}{2}. \]  

(7.19)
On the other hand we can calculate
\[
\int_{\mathcal{N}(d_0)} Z(s(\xi))\chi^\delta(r(\xi, \Gamma))\Delta \hat{w}(\xi) \, d\xi
\]
\[
= - \int_{\mathcal{N}(d_0)} \nabla \{ Z(s(\xi))\chi^\delta(r(\xi, \Gamma)) \} \cdot \{ \nabla \hat{w}(\xi) \} \, d\xi
\]
\[
= - \int_{\mathcal{N}(d_0)} \{ \nabla Z(s(\xi))\chi^\delta(r(\xi, \Gamma)) + Z(s(\xi))\nabla \chi^\delta(r(\xi, \Gamma)) \} \cdot \nabla \hat{w}(\xi) \, d\xi
\]  \hspace{1cm} (7.20)
\[
\leq \| \nabla \hat{w} \|_{L^2(\mathcal{N}(d_0))} \left( \| \nabla Z \|_{L^2(T)} \delta^\frac{1}{2} + \sup_{r \in [-\delta, \delta]} \| \nabla \chi^\delta(r) \|_{L^2(T)} \right) \]
\[
\leq \| \nabla \hat{w} \|_{L^2(\mathcal{N}(d_0))} \left[ \delta^\frac{1}{2} + \frac{\lambda}{2} \right] C,
\]
where we estimated \( |Z| \|_{L^2(T)} \) and \( |\nabla Z| \|_{L^2(T)} \), as in (7.12) and
\[
\left( \int_{\mathcal{N}(d_0)} (\nabla Z(s(\xi))^2 \chi^\delta(r(\xi, \Gamma))) \, d\xi \right)^\frac{1}{2} \leq C\| \nabla Z \|_{L^2(T)} \delta^\frac{1}{2}.
\]
Combining (7.20) with the estimates (7.19) we obtain for \( \delta \) small enough
\[
\| \nabla \hat{w} \|_{L^2(\mathcal{N}(\delta))} \geq \frac{C(1 - \lambda^2) - \delta^\frac{1}{2} \lambda^\frac{1}{2}}{\left[ \delta^\frac{1}{2} + \frac{\lambda}{2} \right]} \geq C > 0,
\]
hence (7.14). The theorem is proved. \( \square \)

8. Appendix

Lemma 8.1. Let \( \mu(s) \) be any eigenvalue of \( \mathcal{L}^s \) such that
\[
\epsilon_0 = \frac{1}{\sigma(m_\delta)} - 1 - \sup_{s \in T} \mu(s) > 0.
\]  \hspace{1cm} (8.1)
Let \( \psi(s, \cdot) \) be one of the normalized eigenfunctions corresponding to \( \mu(s) \). There exists \( z_0 = z_0(\epsilon_0) > 0 \) and \( \lambda_0 = \lambda_0(\epsilon_0) > 0 \) such that for \( \lambda \in (0, \lambda_0) \), we have that for \( |z| \geq z_0 \), for all \( s \in T \)
\[
|\psi(s, z)| \leq e^{-\alpha(\epsilon_0)(|z| - z_0)} \| \hat{J} \|_2,
\]  \hspace{1cm} (8.2)
where \( \alpha(\epsilon_0) \) is given in (8.13).

Proof. Let \( \mu(s) \) and \( \psi(s, \cdot) \) be as in the hypothesis, then
\[
\frac{\psi(s, z)}{\sigma(m_A(s, \lambda z))} - (\hat{J} * \psi)(s, z) = \mu(s)\psi(s, z) \quad z \in I_\lambda.
\]  \hspace{1cm} (8.3)
By the definition of \( m_A \), see (2.11) and (2.14), there exists \( C > 0 \) so that
\[
\sup_{s \in T} |\sigma(m_A(s, \lambda z)) - \sigma(m(z))| \leq \lambda C.
\]  \hspace{1cm} (8.4)
Since \( \lim_{|z| \to \infty} \sigma(m(z)) = \sigma(m_\delta) \), there exists \( z_0 = z_0(\epsilon_0) > 0 \) so that for \( |z| \geq z_0 \)
\[
\frac{1}{\sigma(m(z))} - 1 > \sup_{s \in T} \mu(s) + \frac{\epsilon_0}{2}.
\]  \hspace{1cm} (8.5)
Set for \( |z| \geq z_0 \)
\[
A^0(s, z) = \frac{1}{\sigma(m(z))} - \mu(s) = \frac{\sigma(m(z))}{1 - \mu(s)\sigma(m(z))}.
\]
By (8.5) there exists $\epsilon_1 = \epsilon_1(\epsilon_0)$ so that for all $s \in T$

$$0 < A_0^0(s, z) < 1 - \epsilon_1, \quad |z| \geq z_0.$$  \hfill (8.6)

Set for $|z| \geq z_0$

$$A^\lambda(s, z) = \frac{1}{\sigma(m_A(s, \lambda z))} - \mu(s) = \frac{\sigma(m_A(s, \lambda z))}{1 - \mu(s)\sigma(m_A(s, \lambda z))}.$$  \hfill (8.7)

By (8.4) we have that

$$|A^\lambda(s, z) - A_0^0(s, z)| \leq C\lambda, \quad \forall s \in T.$$  \hfill (8.8)

Choose then $\lambda_0 = \lambda_0(\epsilon_0)$ small enough so that that for $\lambda \leq \lambda_0$, $z_0 < \frac{1}{2\lambda}$ and

$$|A^\lambda(s, z) - A_0^0(s, z)| \leq \frac{\epsilon_1}{2}, \quad \forall s \in T.$$  \hfill (8.9)

From (8.3)

$$\psi(s, z) = A^\lambda(s, z)(\mathcal{J} \ast z \psi)(s, z).$$  \hfill (8.10)

Suppose $z = z_0 + n$ where $n$ is any integer such that $z_0 + 2n \leq \frac{1}{\lambda}$. Same can be done when $z < 0$ and by simple interpolation argument for any $z \in [z_0 + n, z_0 + n + 1)$. We have, see (8.10),

$$|\psi(s, z_0 + n)| \leq A^\lambda(s, z_0 + n)((\mathcal{J} \ast z \psi)(s, z_0 + n)).$$  \hfill (8.11)

We iterate $n$ times (8.11). The support of $n$ fold convolution is the interval $[z_0, z_0 + 2n]$. By (8.9) we obtain the following estimate

$$|\psi(s, z_0 + n)| \leq \left[1 - \frac{\epsilon_1}{2}\right]^n(\mathcal{J} \ast z \psi)(s, z_0 + n)|$$

$$\leq \left[1 - \frac{\epsilon_1}{2}\right]^n\|\mathcal{J} \ast z \psi\|_2 = \left[1 - \frac{\epsilon_1}{2}\right]^n\|\mathcal{J}\|_2 = e^{-\alpha(\epsilon_0)}\|\mathcal{J}\|_2$$  \hfill (8.12)

where, since $\epsilon_1 = \epsilon_1(\epsilon_0)$,

$$\alpha(\epsilon_0) = \log \frac{1}{\left[1 - \frac{\epsilon_1}{2}\right]}.$$  \hfill (8.13)

The thesis follows. \hfill \Box

**Proof of Lemma 4.1** Take $\xi$ and $\xi'$ in $\mathcal{N}(d_0)$. Write in local variables $\xi = \gamma(s) + \nu(s)r$ and $\xi' = \gamma(s') + \nu(s')r'$. It is convenient to express the difference

$$\xi - \xi' = \gamma(s) + \nu(s)r - (\gamma(s') + \nu(s')r')$$

in terms of $s^* = \frac{s + s'}{2}$ and $r^* = \frac{r + r'}{2}$, the midpoints between $s$ and $s'$ and $r$ and $r'$ respectively. This allows to get some cancellations. We have

$$\gamma(s) = \gamma(s^*) + \gamma'(s^*)(s - s^*) + \frac{1}{2}\gamma''(s^*)(s - s^*)^2 + \frac{1}{6}\gamma'''(s^*)(s - s^*)^3,$$

$$\nu(s) = \nu(s^*) + \nu'(s^*)(s - s^*) + \frac{1}{2}\nu''(s^*)(s - s^*)^2 + \frac{1}{6}\nu'''(s^*)(s - s^*)^3$$

where $s \in (s, s')$ and it might change from one occurrence to the other. Similarly expressions hold for $\gamma(s')$ and $\nu(s')$. Since $s - s^* = \frac{s - s'}{2}$ and $s' - s^* = \frac{s' - s}{2}$ we have

$$\gamma(s) - \gamma(s') = \gamma'(s^*)(s - s') + \frac{1}{24}\gamma'''(s^*)(s - s')^3.$$
Note that the term
\[ \frac{1}{2} \gamma''(s^*)(s - s^*)^2 - \frac{1}{2} \gamma''(s^*)(s' - s^*)^2 = 0. \]

Further
\[ \nu(s)r - \nu(s')r' = \nu(s^*|[r - r'] + \nu'(s^*)(s - s')r^* \]
\[ + \frac{1}{8} \nu''(s^*)(s - s')^2(r - r') + \frac{1}{24} \nu'''(\tilde{s})(s - s')^3r^*. \] (8.14)

Taking into account that \( \nu'(s) = -k(s)\gamma'(s) \), we have
\[ \xi - \xi' = \gamma'(s^*)(s - s')[1 - k(s^*)r^*] + \nu(s^*)(r - r') \]
\[ + \frac{1}{8} \nu''(s^*)(s - s')^2(r - r') \]
\[ + \frac{1}{24} \nu'''(\tilde{s})(s - s')^3r^* + \frac{1}{24} \gamma'''(\tilde{s})(s - s')^3. \] (8.15)

Denote by \( a \) and \( b \) the following vectors
\[ a = \gamma'(s^*)(s - s')[1 - k(s^*)r^*] + \nu(s^*)(r - r'), \]
\[ b = \frac{1}{8} \nu''(s^*)(s - s')^2(r - r') + \frac{1}{24} \left( \nu'''(\tilde{s})(s - s')^3r^* + \gamma'''(\tilde{s})(s - s')^3 \right). \]

It is important to notice that for \( |s - s'| \leq \lambda \) and \( |r - r'| \leq \lambda \) we have \( |b| \leq C\lambda^3 \). By Taylor expansion up to the second order of \( J^\lambda(\cdot) \) we get that there exists \( c^* \in \mathbb{R}^2 \) so that
\[ J^\lambda(\xi - \xi') = J^\lambda(a) + (\nabla J^\lambda)(a) \cdot b + \frac{1}{2} b \cdot (D^2 J^\lambda)(c^*) \cdot b, \] (8.16)

where we denote by \( (\nabla J^\lambda)(a) \) the gradient of \( J^\lambda \) computed in \( a \) and by \( D^2 J^\lambda(c^*) \) the matrix of the second derivatives of \( J^\lambda(\cdot) \) computed at \( c^* \). Notice that \( \|\nabla J^\lambda\|_\infty \leq C\lambda^{d-1} \), since \( \lambda^{-d} \) comes from the normalization and \( \lambda^{-1} \) by differentiating one time, \( \|D^2 J^\lambda\|_\infty \leq C\lambda^{2-d} \), since \( \lambda^{-d} \) comes from the normalization and \( \lambda^{-2} \) by differentiating twice. When \( |s - s'| \leq \lambda \) and \( |r - r'| \leq \lambda \) we then obtain
\[ |(\nabla J^\lambda)(a) \cdot b| \leq C\lambda^{2-d} \]
\[ |b \cdot (D^2 J^\lambda)(c^*) \cdot b| \leq C\lambda^{4-d}. \]

Define
\[ J^\lambda(s', r', r') = J^\lambda(a) = J^\lambda((s - s')[1 - k(s^*)r^*], (r - r')) \]
\[ R_1(s', r', r') = (\nabla J^\lambda)(a) \cdot b \] (8.17)
\[ R_2(s', r', r') = \frac{1}{2} b \cdot (D^2 J^\lambda)(c^*) \cdot b. \] (8.18)

Therefore, see (2.7), we obtain
\[ \int_{\mathcal{N}_{(d,\alpha)}} J^\lambda(\xi - \xi') u(\xi') d\xi' = \int_{\mathcal{T}} J^\lambda(s', r', r') u(s', r') \alpha(s', r') ds' dr' \]
\[ + \int_{\mathcal{T}} R_1(s', r', r') u(s', r') \alpha(s', r') ds' dr' \]
\[ + \int_{\mathcal{T}} R_2(s', r', r') u(s', r') \alpha(s', r') ds' dr', \] (8.19)

where
\[ \left| \int_{\mathcal{T}} R_1(s', r', r') \alpha(s', r') ds' dr' \right| \leq C\lambda^2, \]
\[ \left| \int_{\mathcal{T}} R_2(s', r', r') \alpha(s', r') ds' dr' \right| \leq C\lambda^4. \]
