Proto–History (from WIKIPEDIA)

Giulio Carlo, Count Fagnano, and Marquis de Toschi (December 6, 1682 – September 26, 1766) was an Italian mathematician. He was probably the first to direct attention to the theory of *elliptic integrals*. Fagnano was born in Senigallia.

He made his higher studies at the *Collegio Clementino* in Rome and there won great distinction, except in mathematics, to which his aversion was extreme. Only after his college course he took up the study of mathematics.

Later, without help from any teacher, he mastered mathematics from its foundations.

Some of His Achievements:

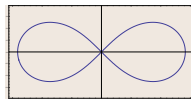

- $\pi = 2i \log \frac{1-i}{1+i}$
- Length of *Lemniscate*

Carlo Fagnano

Collegio Clementino

Lemniscate

$$(x^2 + y^2)^2 = 2a^2(x^2 - y^2)$$
$$\ell = 4 \int_0^a \frac{a^2 dr}{\sqrt{a^4 - r^4}} = \frac{a\sqrt{\pi}\Gamma(\frac{5}{4})}{\Gamma(\frac{3}{4})}$$

Length of Ellipses

$$\mathcal{E} : \frac{x^2}{4} + \frac{y^2}{16} = 1$$

The length of the arc of a plane curve
 $y = f(x), f : [a, b] \rightarrow \mathbb{R}$ is:

$$\ell = \int_a^b \sqrt{1 + (f'(t))^2} dt$$

Applying this formula to \mathcal{E} :

$$\begin{aligned} \ell(\mathcal{E}) &= 4 \int_0^4 \sqrt{1 + \left(\frac{d\sqrt{16(1 - t^2/4)}}{dt} \right)^2} dt \\ &= 4 \int_0^1 \sqrt{\frac{1 + 3x^2}{1 - x^2}} dx \quad x = t/2 \end{aligned}$$

Length of Ellipses

$$\mathcal{E} : \frac{x^2}{4} + \frac{y^2}{16} = 1$$

The length of the arc of a plane curve
 $y = f(x), f : [a, b] \rightarrow \mathbb{R}$ is:

$$\ell = \int_a^b \sqrt{1 + (f'(t))^2} dt$$

Applying this formula to \mathcal{E} :

$$\begin{aligned} \ell(\mathcal{E}) &= 4 \int_0^4 \sqrt{1 + \left(\frac{d\sqrt{16(1 - t^2/4)}}{dt} \right)^2} dt \\ &= 4 \int_0^1 \sqrt{\frac{1 + 3x^2}{1 - x^2}} dx \quad x = t/2 \end{aligned}$$

If y is the integrand, then we have the identity:

$$y^2(1 - x^2) = 1 + 3x^2$$

Length of Ellipses

$$\mathcal{E} : \frac{x^2}{4} + \frac{y^2}{16} = 1$$

The length of the arc of a plane curve
 $y = f(x)$, $f : [a, b] \rightarrow \mathbb{R}$ is:

$$\ell = \int_a^b \sqrt{1 + (f'(t))^2} dt$$

Applying this formula to \mathcal{E} :

$$\begin{aligned} \ell(\mathcal{E}) &= 4 \int_0^4 \sqrt{1 + \left(\frac{d\sqrt{16(1 - t^2/4)}}{dt} \right)^2} dt \\ &= 4 \int_0^1 \sqrt{\frac{1 + 3x^2}{1 - x^2}} dx \quad x = t/2 \end{aligned}$$

If y is the integrand, then we have the identity:

$$y^2(1 - x^2) = 1 + 3x^2$$

Apply the invertible change of variables:

$$\begin{cases} x = 1 - 2/t \\ y = \frac{u}{t-1} \end{cases}$$

Arrive to

$$u^2 = t^3 - 4t^2 + 6t - 3$$

The Discriminant of an Equation

The condition of absence of singular points in terms of a_1, a_2, a_3, a_4, a_6

Definition (The discriminant of a Weierstraß equation is the following quantity)

$$\Delta'_E := \frac{1}{2^4 3^3} \left(-a_1^5 a_3 a_4 - 8a_1^3 a_2 a_3 a_4 - 16a_1 a_2^2 a_3 a_4 + 36a_1^2 a_3^2 a_4 \right. \\ \left. - a_1^4 a_4^2 - 8a_1^2 a_2 a_4^2 - 16a_2^2 a_4^2 + 96a_1 a_3 a_4^2 + 64a_4^3 + \right. \\ \left. a_1^6 a_6 + 12a_1^4 a_2 a_6 + 48a_1^2 a_2^2 a_6 + 64a_2^3 a_6 - 36a_1^3 a_3 a_6 \right. \\ \left. - 144a_1 a_2 a_3 a_6 - 72a_1^2 a_4 a_6 - 288a_2 a_4 a_6 + 432a_6^2 \right)$$

Definition

Two Weierstraß equations over \mathbb{F}_q are said (affinely) equivalent if there exists a (affine) of the following form

$$\begin{cases} x \longleftarrow u^2 x + r \\ y \longleftarrow u^3 y + u^2 s x + t \end{cases} \quad r, s, t, u \in \mathbb{F}_q$$

The definition of $E(\mathbb{F}_q)$

Let E/\mathbb{F}_q elliptic curve, $\infty := [0, 1, 0]$. Set

$$E(\mathbb{F}_q) = \{[X, Y, Z] \in \mathbb{P}_2(\mathbb{F}_q) : Y^2Z + a_1XYZ + a_3YZ^2 = X^3 + a_2X^2Z + a_4XZ^2 + a_6Z^3\}$$

or equivalently

$$E(\mathbb{F}_q) = \{(x, y) \in \mathbb{F}_q^2 : y^2 + a_1xy + a_3y = x^3 + a_2x^2 + a_4x + a_6\} \cup \{\infty\}$$

We can think either

- $E(\mathbb{F}_q) \subset \mathbb{P}_2(\mathbb{F}_q)$ \rightarrow geometric advantages
 - $E(\mathbb{F}_q) \subset \mathbb{F}_q^2 \cup \{\infty\}$ \rightarrow algebraic advantages
- ∞ might be thought as the “vertical direction”

Definition (line through points $P, Q \in E(\mathbb{F}_q)$)

$$r_{P,Q} : \begin{cases} \text{line through } P \text{ and } Q & \text{if } P \neq Q \\ \text{tangent line to } E \text{ at } P & \text{if } P = Q \end{cases} \quad \text{projective or affine}$$

- if $\#(r_{P,Q} \cap E(\mathbb{F}_q)) \geq 2 \Rightarrow \#(r_{P,Q} \cap E(\mathbb{F}_q)) = 3$
if tangent line, contact point is counted with multiplicity

History (from WIKIPEDIA)

Carl Gustav Jacob Jacobi

(10/12/1804 – 18/02/1851) was a German mathematician, who made fundamental contributions to elliptic functions, dynamics, differential equations, and number theory.

Some of His Achievements:

- Theta and elliptic function
- Hamilton Jacobi Theory
- Inventor of determinants
- Jacobi Identity
$$[A, [B, C]] + [B, [C, A]] + [C, [A, B]] = 0$$

Theorem

The addition law on $E(\mathbb{F}_q)$ has the following properties:

- (a) $P +_E Q \in E(\mathbb{F}_q)$ $\forall P, Q \in E(\mathbb{F}_q)$
- (b) $P +_E \infty = \infty +_E P = P$ $\forall P \in E(\mathbb{F}_q)$
- (c) $P +_E (-P) = \infty$ $\forall P \in E(\mathbb{F}_q)$

Theorem (Hasse)

Let E be an elliptic curve over the finite field \mathbb{F}_q . Then the order of $E(\mathbb{F}_q)$ satisfies

$$|q + 1 - \#E(\mathbb{F}_q)| \leq 2\sqrt{q}.$$

So $\#E(\mathbb{F}_q) \in [(\sqrt{q} - 1)^2, (\sqrt{q} + 1)^2]$ the Hasse interval \mathcal{I}_q

Example (Hasse Intervals)

q	\mathcal{I}_q
2	{1, 2, 3, 4, 5}
3	{1, 2, 3, 4, 5, 6, 7}
4	{1, 2, 3, 4, 5, 6, 7, 8, 9}
5	{2, 3, 4, 5, 6, 7, 8, 9, 10}
7	{3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13}

μ_m is a cyclic group with m elements (since $p \nmid m$)

Theorem (Existence of Weil Pairing)

There exists a pairing $e_m : E[m] \times E[m] \rightarrow \mu_m$ called *Weil Pairing*, s.t. $\forall P, Q \in E[m]$

- ① $e_m(P +_E Q, R) = e_m(P, R)e_m(Q, R)$ (bilinearity)
- ② $e_m(P, R) = 1 \forall R \in E[m] \Rightarrow P = \infty$ (non degeneracy)
- ③ $e_m(P, P) = 1$
- ④ $e_m(P, Q) = e_m(Q, P)^{-1}$
- ⑤ $e_m(\sigma P, \sigma Q) = \sigma e_m(P, Q) \forall \sigma \in \text{Gal}(\bar{K}/K)$
- ⑥ $e_m(\alpha(P), \alpha(Q)) = e_m(P, Q)^{\deg \alpha} \forall \alpha$ separable endomorphism

Weil Pairing

Let E/K and $m \in \mathbb{N}$ s.t. $p \nmid m$. Then

$$E[m] \cong C_m \oplus C_m$$

We set

$$\mu_m := \{x \in \bar{K} : x^m = 1\}$$

μ_m is a cyclic group with m elements (since $p \nmid m$)

Theorem (Existence of Weil Pairing)

There exists a pairing $e_m : E[m] \times E[m] \rightarrow \mu_m$ called *Weil Pairing*, s.t. $\forall P, Q \in E[m]$

- ① $e_m(P +_E Q, R) = e_m(P, R)e_m(Q, R)$ (bilinearity)
- ② $e_m(P, R) = 1 \forall R \in E[m] \Rightarrow P = \infty$ (non degeneracy)
- ③ $e_m(P, P) = 1$
- ④ $e_m(P, Q) = e_m(Q, P)^{-1}$
- ⑤ $e_m(\sigma P, \sigma Q) = \sigma e_m(P, Q) \forall \sigma \in \text{Gal}(\bar{K}/K)$
- ⑥ $e_m(\alpha(P), \alpha(Q)) = e_m(P, Q)^{\deg \alpha} \forall \alpha$ separable endomorphism

The last one needs to be discussed further!!!
